Taos: Acorn's future replacement for RISC OS?

The secrets behind the writing of Archimedes Elite

MAKE THE MOST OF **JULTI-ME**

Are you wondering how to make the most of the multimedia resources available to you - scanned images (drawings or photos etc), video clips, music and sound samples, Replay movies, MPEG video clips or movies, teletext.....?

Computer Concepts offer a range of related products that can help you produce your own sound and video productions; all the hardware and software you need to input, manipulate and output stills, video and sound.

The ultimate multimedia expansion card --combining the functionality of a high quality (24bit) video digitiser with real time digital movie capture facilities, stereo sound sampling and playback, plus MIDL All the software you will need to manipulate the captured data is included in the package - TakeTwo for

video manipulation, ScanLight for grabbing and manipulating still images, AudioWorks for manipulating audio samples and generating audio effects and !AudioCtrl provides mixing facilities. The card is also sold with real time video movie compression software from Eidos, which considerably speeds up and simplifies the process of movie generation. The video files you create ean be played back using Acorn Replay. Suitable for any Acorn RISC computer except 3000/4000 series, requires 2MBytes RAM and RISC OS 3.1 or later (4MBytes, an ARM3 and a high data rate IDE or SCSI hard drive for movie recording and sound output).

An optional extra is the latest release from Eidos their Eidoscope video editing software, which can be used to edit movies

created on an Eagle card and includes many professional video editing tools.

Price: Eagle card with Eidos compression software: £329 + £6 p&p + VAT (£386.57 inc.) Eagle card with Eidoscope: £449 + £6 p&p + VAT (£534.62 inc.) Eidoscope for existing Eagle owners: £169 + VAT (£198.57 inc.)

A 16 bit audio sampling and play back expansion card. Features include stereo line-level input and ontput, MIDI connection and software support. A copy of AudioWorks is included to handle the capture, manipulation and playback of samples and a copy of !AudioCtrl which controls the Lark's sampling options (for example sampling to memory or disc, continuous of single shot sampling, background or foreground sampling and setting of sample rates and formats), Suitable for any Acorn RISC computer except 3000/4000 series, requires 2MByte and RISC OS 3.1 or later. Price £199 + £6 pop + VAT (£240.87 inc.)

MidiMax Card

An expansion card designed to provide a stand alone MIDI solution at an affordable price, A 16 hyte memory buffer is included on the card for both transmit, and receive which means no data is lost even when the MIDI interface is transmitting at maximum rate. Standard MIDI In, Out and Thru connectors are provided, with the added benefit of a second Out connector to ease the interfacing of multiple devices. MidiMax is supplied with the same MIDI support software as the Eagle M2 and offers full compatibility with Acorn MIDI implementation. Suitable for any Acorn RISC computer except 3000/4000 series, requires 1MByte and RISC OS 3.1 or later.

Price: £69 + £6 p&p + VAT (£88.12 inc.)

IN THE

ACORN WORLD

Combining the ScanLight 256 scanner (400 dpi, 256 grey levels) and GreyHawk digitiser. The digitiser offers real time greyscale video digitising from any video source. Includes the ultra-fast 'TakeOne' previewer, allowing live video in a window on the desktop — at quarter screen size this can update at 50 frames per second, far faster than any other digitiser. ScanLight software provides image enhancement of captured images, such as smoothing,

rotation, cropping, sharpening. Suitable for all models of Acorn RISC computer with 2MBytes.

Computer Concepts offer a range of other colour and greyscale scanners and digitisers — please ask for further details.

Price: £220 + VAT (£258.50 inc.)

The MPEG card allows full screen, full motion MPEG videos to be played back at better than VHS quality, with CD quality stereo sound tracks. MPEG videos can be played from hard disc or MPEG compatible CD ROM drives. Any Video CD format CDs are suitable (feature films, music videos etc) as are multimedia CDs that include MPEG clips. Any application that can display Replay movies can play MPEG movies. The software provides video type control over the movie eg fast forward, pause etc. Any frame can be captured as a 24 bit full colour sprite. Requires a Risc PC with 4MBytes and a suitable RGB monitor or TV capable of 50Hz PAL modes.

Price: £249 + £6 p&p + VAT (£299.62 inc.)

TV tuner comes in two forms; a tuner only device which allows live TV to be displayed, either through connection to a video composite compatible monitor or in a window on the desktop in machines that have a digitiser installed. The user can scan the frequency range, set up frequency pre-sets and select channels. The second option with Teletext software can access and display all the pages available on Teletext, select Teletext or Fastext pages, decode foreign teletext and save pages out as either text or sprite files. Suitable for any Acorn RISC computer except 3000/4000 series, requires 2MBytes and RISC OS 3.1 or later. *Price: TV Tuner only* $\pounds 89 + \pounds 6 p \Leftrightarrow p + VAT$ ($\pounds 111.62$ inc.) TVTuner+Teletext software $\pounds 159 + \pounds 6 p \Leftrightarrow p + VAT$ ($\pounds 193.87$ inc.)

Pioneer 602X CD Rom drive

Many multimedia resources are supplied on CD, so Computer Concepts also include a CD ROM drive in their range. The Pioneer DRM-602X is a double speed (300 kilobytes per second transfer rate), 6 disc CD ROM drive. Multi session PhotoCD compatible. It can also be used for

standard audio compact discs. ArtWorks clip-art CD disc included. Suitable for any model of Acorn RISC computer, requires 2MBytes and a fully Acorn compatible SCSI card with CDFS 2.2. RRP: £499.00 + £10 p&p + VAT (£598.07 inc.)

Computer Concepts have other products in their range which can also be used in this field — for example a range of video genlocks, colour digitisers and flatbed scanners, the ColourCard graphics accelerator card and many more. Please ask for our Product Guide.

Editor's letter

As I write this, the marketplace has gone quite, quite mad. The furore over Acorn's new distribution and sales strategy in the education sector threatens to overshadow the release of its new education-aimed machine, the A7000 - details of which are on page 31.

It's too early to tell what impact Acorn's new policy - described in the News section on page 9 – will have on the cosy Acorn market we're used to, but it's certainly a big gamble. We'll be looking into the effects in detail next month, but there is one good thing to come out of all this: at last, Acorn is doing something about its market. Whether it works is a different matter... Mark Moxon, Editor

40

Taos: We are on the brink of a new era, if only ...

Next month in Acorn User

Acorn User on the Web

Acorn User will be unveiling its new site on the World Wide Web, combining all that is best in your favourite Acorn magazine with the advantages of electronic publishing. If you've ever wanted to get the latest independent information on the Acorn market, or you need to find a review of a product without trawling through your back issues, then the Acorn User web site is for you.

Acorn's new dealer direction

Acorn has completely revamped its dealer network in a bold move to corner the education market. We have a special report on the risks involved and the potential problems that lie ahead, not least the threat to the existing dealer network as we know it.

Composition

Clares' new image composition package gets the once over: it's been a long time coming, but is it worth the wait?

The A7000 in education

The A7000 is unashamedly an education machine, and next month we'll be looking at the new machine from an educationalist's point of view. Does it ensure that Acorns are still the best machines for education?

Carriage is free within mainland UK if you pay on ordering.

Cheques should be made payable to lan Copestake Limited.

You may also pay by **credit card**, **debit card** or **Switch**. We normally make **no charge** for this, and take no payment until goods are despatched. We need your address as known to the card issuer.

If you leave an order on our answering machine please It you leave an **antime** please include your telephone number, your card number and its expiry date (and issue number if any), and your calcula-tion of the total payment due.

Official orders are welcome from UK educational and government institutions (invoices are due for payment within 14 days and are subject to carriage and late payment charges).

VAT is not included. Zero-rated items are marked V0. UK customers please add 171/2% to all other prices. EC customers outside the UK please do the same unless you are VAT-regis-tered, in which case quote your international VAT number. Ours is G8 595 7258 84

Overseas carriage: If you are paying by credit card we will add air-mail and insurance at cost. Otherwise please add £6 (Europe) or at least £12 (elsewhere) for each software item and send a pounds sterling bank draft payable at a London clearing bank, or Eurocheques for not more than £100 each each.

eacn. All products, prices and specifications are offered in good faith and are sub-ject to availability and change without notice. Special offers apply only while stocks last. We process all orders immediately, but suppliers do some-times keep us waiting. Goods are guaranteed but we do not supply them on approval Returns and cancel-lations can only be accepted by prior agreement and there may be a charge agreement and there may be a charge to cover the costs involved.

PC Survival Guide

REAL

ONLY £5.95 ex. postage (Code BKP1b)

Read about DOS, Windows, Partitions, DRAM, Sound Cards, File Compatibility etc. Contains tutorials on how to set up your system, including installing video drivers, CD-ROM drivers and expansion cards.

Whatever your Acorn computer, if you want PC compatibility this is the book for you. PCs are in a different world and there is a great deal you should know before making a decision that could cost you dearly later.

The Beebug PC Survival Guide covers in detail the wide range of options available for running PC software AND hardware on your Acorn computer.

The various software emulators and hardware expansion cards, including Acorn's new Risc PC 486 Card, are examined in depth. Hardware and software requirements are detailed, and solutions provided for common problems.

Whichever PC operating system you want to use, you'il find the information you need in this invaluable guide. Easy-to-follow 'hands on tutorials' make installation problems a thing of the past.

News

Acorn broadens its range

IT was with little surprise that Acorn User learned of the launch of two new Acorn computers, the A7000 and the Risc PC 700, plus the updating of the trusty Risc PC 600. Compared to when Acorn launched the original Risc PC 600 over a year ago, when the press was briefed months in advance of actual public launch, official news of the new machines had been kept concealed until the last minute so that Acorn could co-ordinate a joint product and education strategy announcement. While the Acorn strategy has proved highly controversial, in design and specification terms, the new computers represent subtle evolutionary changes rather than anything radical.

All the newly announced models are supplied with RISC OS 3.60 which resides in an on-board ROM doubled in size to 4Mb. Several bundled RISC OS applications have now been returned to the OS ROM. OS code executed off the ROM runs faster than before, the new ADFS filecore is implemented to eliminate partition size restrictions on hard discs, and there is a most impressive integral JPEG image decompression routine which works almost instantaneously.

Disappointingly, Acorn is not releasing RISC OS 3.60 as an upgrade for existing machines until at least next year. While Clan members have been given the opportunity to 'test' the new filecore code at their own risk, Acorn has decided that the upgrade issue is too much of a mine field for now. RISC OS 3.6 would mean a hard disc reformat, plus a new *'Boot* arrangement for example, a task far more fraught with danger than simply swapping some ROM chips.

On the hardware side, the main improvement is the inclusion of on-board 16-bit stereo sound as standard, complete with ATAPI CD-ROM drive support and a fixed audio mixer to enable convenient combined computer generated and CD sound rendition. ATAPI is a new IDE-based disc controller standard with an open software interface specification. The new Risc PC 700 shares a near-identical main board with its new Risc PC 600 sibling. As with the A5000, there are no clear external indications to show that the new model is any dilferent to the earlier one, bar the use of a new style Logitech mouse.

Internally, the Risc PC 600 gets a 10 per cent power hoost through its 33MHz ARM610, up from 30MHz, though in some areas the new Risc PC 600 will be more than 10 per cent faster than the original because of the RISC OS ROM performance

improvement. The Risc PC 700 has a 40MHz ARM710, which Acorn says can enable the Risc PC 700 to be up to 40 per cent faster than the original Risc PC 600. In PC terms, the improvement can be likened to a comparison between a 486DX2/66 and a 486DX4/100. However, until Digital-produced StrongARMs enter the equation - probably in 1996 - it's not quite possible to say that Acorn has entered Pentium-level performance territory just vet.

Compared with the ARM710, the alternative ARM700 processor module continues to cause development headaches at Acorn and in any case it will be clocked down to

33MHz to match the maximum clock rate of the FPA11 floating point accelerator chip. This news will frustrate a vocal number of potential users who need fast floating point maths, hut at least Acorn has finally released some end-user products based on the ARM7 family of processors for the first time.

PC users now being encouraged to go for a minimum of 8Mb RAM might ridicule Acorn's 2Mb minimum specification of the A7000, but the ARM architecture has good code density, RISC OS programs are comparatively compact, there is no RAM wasted on disc or processor caches, and the operating system lives in its own 4Mb ROM. A 2Mh A7000 is therefore more comparable with a 4-6Mb PC.

Externally, the neat plastic-clad case bears a passing family resemblance to the highly innovative all-plastic Risc PC: underneath, however, there is a more conventional metal case. It's actually based on the case used by Online Media for its original set-top box design. Users have the choice of litting a single internal 5.25in device, like a CD-ROM or a single full size expansion card.

So what about prices? With Acorn's new direct-sell education policy, education prices have been reduced generously across the board. However, the retail deal now looks comparatively less attractive. Full pricing for the new machines is given on page 33. The RRP of the Risc PC 700 with

8Mb DRAM, 2Mb VRAM, 850Mb HD and AKF60 14in monitor is roughly £100 more than the typical selling price of an old Risc PC 600 with only 1Mb VRAM and half the hard disc capacity at 420Mb. On top of that, the new model has a faster processor, integrated 16-bit sound, RISC OS 3.6 and a better printer port, so Acorn has certainly delivered improved value for money – much to the probable annoyance of those who have just bought a Mk I Risc PC! It's an even better deal for education customers, though we discuss that topic in a separate news story on page 10.

The all-new A7000 is a quantum leap from the old A4000, but is only marginally more expensive than the former typical A4000 selling price. In fact, Acorn has massacred the education price of the A4000 in the wake of the A7000 and claims it is still in production. A3010s and A3020s, however, while remaining on the official price list, are no longer produced. In fact, Beebug reportedly purchased Acorn's entire remaining stock of A3010s.

The new improved Risc PC specifications enhance an already attractive design and the new A7000 is an essential offering for the education market, but despite reduced prices, some continue to say that Acorn is losing the value for money contest with the PC community. On page 31 in this issue we look at the new Acorns in greater depth.

IN one fell swoop Acorn has effectively dismissed two thirds of its registered approved education dealers. The controversial move is part of a radical re-structuring of Acorn's education policy. Although painful, Acorn is adamant it had no choice but to make sweeping changes in order to maintain existing business and successfully gain a new education market share.

Acorn says members of its old dealer network were guilty of being too pre-occupied in competing among themselves to win education tenders put out by established Acorn schools. The net result was that margins were cut to the bone, and dealers – which had cut-price box-shifters moving in on the deal at the last minute and, because of the intense competition, not enough resources – were being directed at winning tenders with schools new to Acorn, in other words beating RM, Apple and the PC vendors.

Acorn's answer has been to axe its education dealer network and introduce a direct selling policy towards education customers with a fixed price. Without employing a large direct-sales task force, like RM for example, Acorn still needs the support of effective education dealers around the country. Therefore, Acorn has appointed official agents to represent Acorn in the education market. These agents have been given exclusive territories in which schools will earn their regional agents commission payments for all computer orders received by Acorn, whether or not the school was directly approached by their agent dealer.

It sounds like a good idea: there is price stahility, Acorn effectively gets an RM-style direct sales force in the form of its appointed agents, and these dealers get guaranteed business according to their territory. The bad news is that Acorn has decided to award agencies to just 25 or so of the formerly 70-plus strong network of former Acorn education dealers. For those dealers left out, there was the further insult of not being officially informed of the new arrangements. Some only found out of the new arrangements via mailings directed at the software development side of their businesses. A week after the announcement, former dealers had still not received official communication from Acorn regarding their changed status. Dealers were telling *Acorn User* they were receiving orders from schools and not knowing what to do with them.

While previously, some ordinary Acorn dealers proved they could still earn business in schools outside the original official Acorn education dealership, it will be much more difficult now. Acorn's fixed education prices are mostly below the trade price of ordinary retail dealers. Without the Acorn commission enjoyed hy agents, some of which will not actually be earned by their sales efforts, ordinary dealers would have to sell Acorn computers at a loss and hope to add considerable value in the form of networks, consultancy, peripherals, etc. With cost prices per computer differing by as much as £200, the uphill struggle is all too apparent. Acorn says it has a scheme to promote retail dealers, but this had not been revealed at press time, generating further complaints about the manner in which Acorn was handling the situation.

Many of the disenfranchised dealers have predictably voiced their anger at what amounts to a sense of betrayal by Acorn. The list of well known names not awarded agencies is sobering. A sample number includes The Data Store (Bromley), Desktop Projects, Senlac Computing, Minerva, Kimberley Computer Services, CJE Micros, Cambridgeshire Software House, lan Copestake and Castle Technology, to name but a few.

Acorn, while sympathetic with their plight, has indicated that the vast majority of effort and success in the education market is actually accounted for by the companies offered education agencies. This could he interpreted that those left out weren't effective enough or, in some cases, have been distracted by other platforms, like PCs. Some supporting Acorn's line have even suggested that if some of the dealers left in the cold had put as much effort into their

businesses as they had in complaining, they wouldn't have found themselves in such dire consequences.

However, at least one dealer we spoke to claimed £200,000 worth of Acorn education business in the last year – despite cut throat competition from box-shifters. He felt that he was exactly the type of dealer who should have been helped hy Acorn, not abandoned. Another dealer, Minerva, had just closed its retail operation in order to re-focus on education. Now that investment is wasted. The Data Store, which has built up a well-respected service reputation in the Acorn community, told *Acorn User* it had now approached Apple for dealership information. Without exception, all the ex-education dealers we spoke to were bitter at the manner in which the new policy had been introduced.

Of the successful agency-appointed dealers we spoke to, all were optimistic ahout their prospects and one confirmed that Acorn had provided a playing field in which it could confidently work with optimism to expand its husiness through established Acorn customers and compete successfully in new school tender opportunities against RM and Apple. However, one such agent also admitted that the way the scheme had been implemented was troubling and another suggested it could have been done differently, involving more dealers, while at the same time cutting out the seriously dead wood.

Acorn User has detected a general consensus that Acorn had to do something to re-organise its education marketing or risk falling victim to a progressively shrinking market and weakening dealer force. Some dealers have accepted their fate with sad resignation, adding that they will probably be forced out of the Acorn market completely. Acorn says there is still a bright future for its 400 or so remaining registered dealers. But until Acorn shows its consumer and retail hand, there is little optimism outside the education market, especially as the smaller dealers picked up vital sales from teachers and parents off the back of their schools presence.

After the initial fall-out had settled, concerns were emerging about the huge territories awarded to some agents, sometimes over a hundred miles end-to-end. Could these agents adequately serve the thousands of schools in their areas? Was there really a viable place for the dealers left out of the scheme? How would the schools react? *Acorn User* will be examining these questions in a special feature next month.

Widget Software, which specialises in the Psion Series 3 pocket computer, has produced a 'toast' rack for Series 3 and Acorn Pocket-Book SSDs (solid state disc cartridges). The anodised aluminium rack matches Widget's Series 3 desk stand Introduced two years ago which has sold over 10,000 units.

Cumana drives

CUMANA, the UK's leading manufacturer and supplier of multimedia products, has recently announced a number of enhancements to its extensive range of CD-ROM drives. Cumana can now offer at least one model which is compatible with every RISC OS computer manufactured by Acorn, from the A3000 right up to Acorn's latest Risc PC and A7000 models.

The Risc PC and the A7000 can either have fitted competitively-priced double-speed IDE drives or quad-speed drives based on the ATAPt standard. Cumana's external parallel-port drives can be used with the current range of Acorn computers and, as a bonus, offer dual compatibility with IBM machines.

Cumana's flagship is its proTeus drive. This combines a quad-speed CD-ROM drive with an optical drive offering 650Mb of re-writable storage per disc. This offers great potential for backing-up data, as well as being a supplement

Cumana has recently expanded its range of CD-ROM drives, along with improvements to its existing range.

to the hard disc, and a very fast CD-ROM drive. The proTeus drive costs $\pm 549 + VAT$, with individual discs priced from $\pm 39 + VAT$. As it is a SCSI device, a SCSI interface will also be needed.

> Cumana Tel: (01483) 503121 Fax: (01483) 451371

KCS releases new Big Keys keyboard

A version of the 8ig-Keys Keyboard for use by youngsters and special needs students has been released in new lower case formats, apparently due to alphabetically arranged keyboards to choose from.

Now three variations are available: lower case black on yellow, yellow on black, and the original upper case version. 8ig-Keys keyboards are priced £85 + VAT and a 'Co-Pilot' accessory, to enable a normal keyboard to be connected at the same, costs £25.49 + VAT.

KC5 Ltd Tel: (01703) 584314 Fax: (01703) 584320 E-mail: 100070.1254@compuserve.com

Parallel port drive from Eesox Eesox has added a parallel port CD-

ROM drive to its range. The 'Bronze' CD-ROM drive comes with Eesox's parallel port CD-ROM driver and is compatible with any Acorn machine which has a bi-directional parallel printer port, like the A3010/3020/4000/A4 and later machines, A 5imon the 5orcerer demo CO is currently being included in the price, along with a £30 voucher towards the cost of making your own custom CO. The basic 8ronze CO-ROM drive is priced £199 inc VAT or £215 inc VAT with CDFast cache software to improve performance.

> Eesox Tel/fax: (01223) 264242 e-mail: eesox@cityscape.co.uk

Official: no Mac clone

Oespite a denial through these very pages in the last issue of Acorn User, speculation has continued that Acorn will produce an Apple PowerMac clone running a licensed version of Apple's Mac OS. As we previously pointed out, Olivetti, Acorn's parent company, does indeed have plans to produce clone Macs, but, despite the appearance of a Sunday Times article repeating the suggestion, Acorn has reconfirmed there are no plans for Acorn to get into the Mac market.

ExpLAN on the launch pad

Tavistock-based ExpLAN Computers Ltd has produced an interesting Acorn Pocket Book data file for aspiring rocket scientists. The software is part of a complete rocket experiment kit, including solidfuelled rocket kits and teachers guide suitable for maths, science and technology classes. The Pocket 800k data file enables the calculation of attainable rocket altitudes according different payload masses.

Not that we have had much need for them for weeks and weeks at the time of writing, but ExpLAN is hoping the demand for lighting suppressors will literally go through the roof. ExpLAN now supplies Phoenix Contact lightning suppressors for isolating Acom local area networks from nature at her most destructive. Phoenix suppressors stop typical lighting spikes at the electricity mains, with solutions starting at £35.

ExpLAN Tel: (01822) 613868

Britain's baffled parents

A NATIONWIDE survey of 1000 UK parents has revealed that they are still struggling to come to grips with the world of computing.

In a survey commissioned by *Parents & Computers* – a new magazine from IDG Media – one of the typical responses was that only 15 correctly described the Internet as the global electronic highway; 133 apparently thought it was part of the European railway system. *Parents & Computers* also compiled a regional league table of adult computer literacy in which Northern Ireland scored top marks.

Full details of the survey will be in the issue one of *Parents & Computers*, which will be on sale 24 August in WH Smiths, Tescos, Sainsburys and other good newsagents. The magazine, edited by *Acorn Computing*'s Pam Turnbull, is a guide to education and computing for all parents who own or are considering buying an Acorn, Mac or PC for their 3 – 11 year-old children

Kimberley offers Acorn alternative

KIMBERLEY Computer Services – not to be confused with Southampton-hased KCS Ltd in another news story – ironically now an ex-official education dealer, has nevertheless ploughed ahead and announced its KCS *NetServer* for schools. Targeting schools who wish to pay less for a multi-platform network server solution, the KCS offering undercuts Acorn's recently announced *SchoolServer* product, which is hased on powerful but higher priced PowerPC technology.

The KCS server is based on a 486DX4/100 plat-

Online Media challenge

ACORN'S digital interactive TV (dITV) division, Online Media, numbers BT as one of its competitors. BT currently uses Apple set top box (STB) hardware in its dITV trials. However, Westminster Cable – a BT subsidiary – is now set to trial OM STBs in a deal struck with OM's partner, Digital Equipment Corp.

Digital will provide multimedia servers and OM the STB technology. Although Westminster Cable is a BT subsidiary, it is not obliged to use products and services supplied by other BT divisions. And even if it did use BT services, it would not be able to negotiate special cost deals as these would contravene strict rules against subsidising within BT. The Digital/OM deal is just the latest in a long line of prestigious contracts won by OM in the last year. form, less powerful than the PowerPC but more than adequate for many schools according to KCS. Prices start at £2750, including 24Mb RAM, PCt expansion bus, 1Gb hard drive, quad-speed CD ROM, 100 Mbit/sec capable ethernet interface, *Windows NT Server 3.5x* and *Arcshare Server* 1.5.

Land of hope and Sibelius

ACORN-BASED music composition goes to the Proms this year as a number of composers have prepared their Proms performances using *Sibelius* 7 on Acorn computers. Such performances include Julian Anderson's *Khorovod* to be performed on 16 August, Malcolm Williamson (Master of the Queen's Music) contributing to A Year of Birds on 19 August, and James Woods' Two men meet, each presuming the other to be from a distant planet, on 11 September. New percussion notations were specially created for the latter by Woods and Sibelius' Jonathan Finn and many of these will be made available to other *Sibelius* users.

Portable delayed

Acorn doesn't deny it has a second-generation Olivetti notebook-based portable under development to replace the venerable A4, but it's now not likely to go on sale until early next year at the earliest. A prototype could well make an appearance at the Acorn World show in October, but it's thought that production engineering difficulties have delayed the project.

On the Pocket Book front, the latest education catalogue from Acorn lists a 1Mb version of the Pocket book for £285 + VAT (Education price), although there has been no official release date set for this product.

DEC_dATA spins its own web

Clip art and educational resource file specialist, DEC_dATA has announced its own World Wide Web (WWW) home page on the Internet. Its brochure can now be found in electronic form at URL http://www.zynet.co.uk/ decdata/ and you can e-mail DEC_dATA at info@decdata.zynet.co.uk DEC_dATA can also be by more conventional means on tel: (01392) 221702.

Parallel port splitter

Misen Electronics has announced a simple device to provide an extra parallel port for all Acorn RISC OS computers. The MI25MTF data switch allows hardware to be connected to two separate ports which are then switched between.

Not only is this more convenient than delving round the back of the machine to swap connectors, it should also prolong the life of the connectors, which can easily be damaged by constant plugging and unplugging.

The data switch costs £17.95 all inclusive.

Misen Electronics Tel/fax: (01722) 712256

INKJET PRINTING SOLUTIONS

CAME

BJ-200EX

A fast and affordable quality mono inkjet. Resolution with smoothing up to 720dpi. The obvious choice if your work is black and white.

BJ-600E

A fast, dedicated inkiet printer. Colour resolution of 360dpi and in mono with smoothing up to 720dpl. Four separate colour inks. The one to go for if the majority of vour work is in colour.

BJ-600e +TurboDriver £389 + £10 p&p +VAT (£468.82 inc.)

REMOVABLE HARDDRIVE SYSTEM

* TOTAL DATA SECURITY * EASY DATA TRANSFER BETWEEN COMPUTERS * IDEAL HARDDISC BACKUP

The removable harddrive system fits into a 5¼" drive slot in the RiscPC and harddrives are available in many sizes which can simply plug in and out of the slot as required. The drive may be locked in place to prevent unauthorized removal. For total security the drive may be removed and stored in a safe place to prevent unauthorized access to your data. Because the removable drives are available in any size (up to at least 1Gb) they are

also ideal for use as backups for existing harddrives, and may be easily transported between different computers for rapid transfer of large datafiles. The system is available for use with both IDE and SCSI filing systems. External boxes are available to enable SCSI removable drives to be used with older Acorn models. Please 'phone for details.

PLC/3 The PLC/. Price £104.57 inc vat 12 & 15) on

- - - - - -

There are now two coders in our range which cover all Acorn computer models and allow Computer output in virtually all screen modes to be converted to a PAL TV signal suitable for recording to a video recorder or displaying on any TV with a Video input socket. The PLC/3 is our standard model which works in any of the 'standard TV' modes (eg modes

PAL TV CODERS

12 & 15) on all Acorn computer models. (Note that the AKF60 & AKF85 monitors will not work in these modes, although the PLC/3 will still produce a TV output with the RiscPC). The PLC/3 has a 15 pin RGB output for the monitor, a BNC for video and an S-VHS socket for S-Video.

A new addition to the range - the AVK/3 will work with all computer models in all screen modes up to 800 x 600 resolution in 16 million colours. It has a remote control with facilities for zooming, freezing & panning the TV picture. Ideal for lectures and demonstrations etc. The AVK/3 includes all connecting cables including a SCART which gives TV frequency RGB O/P for large screen TV's, a phono socket for composite video and an S-VHS socket for S-Video. Note:-Older Acorn Computer models may have 9 pin monitor sockets. 9 to 15pin & 15 to 9 pin

Price £411.25 inc vat

AVK/3

converters are available at £4.11 each.

Graphics

Film recording for less

YOU might not get a cover CD-ROM teeming with goodness knows how many megabytes of this, that and the other, but I have always believed that in an enthusiasts' market you will find people who are less out to make money than put a smile on the face of their fellow users. My belief was no more justified than when, this month, a recently established company popped out of the blue,

offering specialised printing services dedicated to the Acorn graphics user at a price that PC or Mac users would happily amputate their right arms for.

The Digital Darkroom, a company run by an Acorn enthusiast, is offering hassle free, high-resolution colour slide printing direct from the Acorn, for a remarkahly low price. What's more, Picture of the Month prize winners can have their award-winning

artwork printed free of charge, courtesy of the Digital Darkroom. Direct from disc printing of vector graphics or hitmap artwork is otherwise offered at £5 (plus £2 handling charge) for a one-off slide. down to £3.75 (all inclusive) for bigger orders. Compared to all other commercial bureaux I've come across, these prices are unbeatable.

> Digital Darkroom Tel: 0181-311 2001

Serious 3D at long last

IT seems as if my call has been heard. Two companies, one German the other Italian, are on the brink of releasing 3D modelling and rendering packages for the Acorn. The German entrant. Merlin from Evolution Computer, looks remarkably like the elusive Powershade. Is this where the first serious Acorn ray-tracer has finally touched ground? At $\pounds 100 + VAT$ it looks like a powerful intermediate-level package.

The other package has been developed by Italian company Sincronia Soluzioni Multimediali, the official Italian distributor for Acorn. Its series of studio quality modelling and rendering applications begins with the advanced modeller, TopModel. using highly optimised machine code routines which on an ARM610 can generate 9000 fully Phong-shaded, texturemapped triangles per second with true transparency, and an astonishing 33,000 triangles per second in wire frame. There is import and export into industry standard packages such as POVRay and AutoCad 3DStudio. The extensions for professional ray-tracing and animation are to follow the release of the modeller priced at $\pounds 99 + VAT - or \pounds 70$ if you return your old rendering package disks. This promises to be the fastest and most capable 3D graphics package

ever for the Acorn, and with multi-processor cards and a Top Model 40MFlop DSP card in development, this could invite a good few PC and Mac modellers to the Acorn platform. This is exiting stuff indeed, and we will give a full preview of both products in the near luture.

Buena Vista

AT 24K, this is probably the smallest file I have ever awarded Pic of the Month to. Philip Webster of New Malden in Surrey is armed with a Risc PC and 2Mb of VRAM, so there's just as much power behind his artwork as there is skill. Far less technically impressive than some of the other files that Philip sent into the graphics page, this picture, named Valley, is a brilliant example of how ArtWork's graduated fills can be used to tremendous effect. Especially

commendable is the fact that this piece, used as GCSE coursework, was the artist's first picture created in ArtWorks.

Philip receives £20 and his image printed onto slide courtesy of the Digital Darkroom. Prize winners are asked to simply send their entries to the address below to claim their free, colour slide. Please note as well that prize winners will only receive their cheque in the month dated on the issue which their winning Pic appears. Keep 'em coming.

PostScript from Calligraph

Calligraph, in collaboration with a company called Rapport, has developed a full PostScript level 2 RIP for the Acorn. As with all level 2 processes, it gives control over vital areas of imagesetting such as dot gain and screen angles. The RIP has been integrated to also work with the Calligraph range of direct-drive printers. This means the benefits of direct-drive printers can be used in a multi-platform network environment with Unix, PC, Mac and Acorn machines all being able to benefit from the advantage of Calligraph's directdrive technology.

Calligraph Tel: (01223) 566642 Fax: (01223) 566643

Ovation Pro looking qood

Though I should probably leave this to our DTP man, Mr Powell, I thought it important to mention that Beebuq's Ovation Professional will be heading our way in the near future, packed full of fantastic graphics capabilities for the designorientated publishers among us. Irregular frames containing text areas can be drawn with special tools and these frames can be rotated, as can the text within them. How fast these operations will be relative to the rapidity of CC's Impression remains to be seen but Ovation Pro does seem, feature-wise, to fill most of the gaps in pagesetting capabilities that still exist in the present king of the Acorn DTP programs. At present, Impression Publisher is still the only choice for those producing colour-separated output, although this may be added to Ovation Pro later.

Contacting me

You can contact the Graphics page by writing to me, Jack Kreindler, at Acorn User. IDG Media, Media House, Adlington Park, Macclesfield SK10 4NP, or by e-mail to: jack@acornusr.demon.co.uk.

Its finally happened. A company has come up with a simple and inexpensive solution to an age old problem.

Getting access to files stored on a PC has always been a problem for Acorn computer owners. There has always been Floppy Disk transfers, but these are slow and limited to 1.44Mb. There has been several attempts to "Network" the

two computers together but most attempts have been problematic and needed a great deal of extra hardware.

Arcshare is the latest program from KCS which allows any Acorn computer with an Access network card to talk to any PC with a network card & Windows.

Arcshare needs no extra hardware other than cheap network cards. Arcshare is very easy to use through its graphical interface and is, on average 40 times quicker than using a floppy disk, but with no file size limitation. Arcshare can even use CD Rom drives from a different machine.

In the Main screen on Arcshare Client,

both the Acorn and the PC directories are visible. Files can either be copied, or deleted, even new directories can be created on the Acorn from the PC. Arcshare has the advantage, that it can be run directly from the Windows Filemanager so that file manipulation is simple. Arcshare can run under a Windows for Workgroups network in conjunction with other PC's on the same network. There is no limit as to the amount of Acorns that can be seen from the PC on the Access network.

On the Acorn, the PC directories are designed to look just like any other Acorn directory. In fact, Arcshare makes the PC behave as if it were part of an Access network. Files can be copied from the PC directories to acorn directories in the normal manner. Files can even be copied from one PC to another PC via the Acorn.

It's time to join the PC and the Acorn on the same network. Call KCS now to find out more about Arcshare and networking Acorns to PC's.

Arcshare Client v1.4

- Allows file transfers between Acorn and PC Computers.
- * No Filesize Limitation.
- * Automatic Filetyping when the Acorn receives a file so that the file is ready to be loaded into an application straight away.
- * Automatic File Extensions added when a file is transferred from the Acorn to the PC so that the file can be loaded into a program straight away.
- * Easy to Use Graphic Interface.
- No "Dedicated Server" Computer required.
- * Connects directly to Acorn Access Network. Very easy to setup and install.
- * Works with Windows 3.1, 3.11, Windows 95 & Windows NT

Arcshare Server v1.4

- Has ALL the Functions of Arcshare Client v1.4 but with the following additional extras.
- * Allows transfers of files from the Acorn.
- * When a Window is open displaying a PC directory, all the files are filetyped even though they are stored on the PCI
- * Files can even be copied from PC to PC from the Acorn.
- * Any Acom on the Network can access the PC.
- Makes the PC system look like another Acorn Access system.
- Files can be loaded into applications directly from the PC.

Comms

Down at Acorn Town

THE Acorn Computer Group plc World Wide Web server went live on Monday 19 June 1995. The site hosts pages for the three arms of the group – Acorn Computers, ARM Ltd and Online Media, as well as providing links to Olivetti Telemedia. A welcome message from Acorn Group MD Sam Wauchope and brief introduction to the group greets visitors to the site.

As promised last month, here is a screenshot of the Acorn Computers' home page. Acorn has given its Web site a friendly feel using the idea of a small town with buildings to visit containing various resources. Although this main inlined image is 66K of data by using the latest Freeware Internet software available – *ArcWeb* and *FreeNet* – and a V34 modem connection, quite acceptable fetching speeds are now becoming possible.

Most of the graphics used on the pages are beautifully drawn by Webmaster Paul LeBeau, of Cave Rock Software in New Zealand, who designs and maintains the pages, reflecting the truly worldwide nature of the Web. Using the latest *NetScape* web page 'standards', the pictures look best on white backgrounds, capably shown here by *ArcWeb*.

The town has eight main buildings to visit. The Library holds an increasing number of reference documents and application notes, while the Acorn Daily News building contains latest press releases and cuttings, event reports and press comment. The School holds information for teachers, students and education authorities, and Corporate centre, Acorn House deals with marketing and financial information and Customer services.

In danger of attracting the attention of the Trades Descriptions Act, the Airport appears to offer daily flights to Acorn's overseas dealers,

Acorn Town - the Rooftops view.

listing dozens of contacts in countries from Norway to Panama. The University houses the 'tertiary education' service for the higher education community, offering case studies of Acorn in Action, HE resource location details, and information on Networking and the new Risc PC 600X.

The Clan enthusiasts club have a special feelgood kiosk with information on joining, events and other club information. Members with email addresses have already been given special access to their own password protected area which will contain exclusive information on Acorn's future. Currently, it contains only what Clan members have already received by mail. The Store offers product information, prices, dealer lists, special offers and links to free software on the Acorn ftp server.

The Town Square is the central point for announcements and what's new on other pages. The Acorn Web site is certainly worth visiting and provides a colourful and interesting shop window on all Acorn's activities. The URL is quite simple to type: http://www.acorn.co.uk/.

HTMLEdit – Web page editor for RISC OS

I HAVE just received advance information of a new editor software package for producing World Wide Web pages from the RISC OS Desktop. HyperText Mark-up Language (HTML) is the page description text language used for designing WWW pages, and it is possible, but often totally confusing, to design Web pages using a standard text editor such as *Edit* or *Zap*.

The recent Acorn User cover CD-ROM contained Ben Summers' Freeware HTMLTools for use with Impression Style and Publisher, which can make the job a lot easier, but a dedicated editor is really what we need. Andrew Rawnsley's reasonably-priced commercial package may just fit the bill.

According to the pre-release information, you can view and edit the document you are working on with an automatic preview of the document as it will appear on the Web. *HTMLEdit* uses menu and command structures familiar to users

of *Edit*, with the same function key effects, such as F8 Undo. You can also extract the textual information from existing HTML documents as saved online from your Browser.

Other features include full support for images and forms, Netscape extensions where appropriate, all styles and effects available from a toolbox with at most two mouse clicks, and new features can be added. A later hands-on review will explore the possibilities more fully.

HTMLEdit is currently delivered by e-mail with the full, packaged release to follow by post. The single user licence costs £30 (no VAT). Make cheques payable to Andrew Rawnsley and send them, with your e-mail address, to:

R-Comp, 22 Robert Moffat, High Legh, Knutsford Cheshire WA16 6PS E-mail: HTMLEdit@arsvcs.demon.co.uk Fax: (01925) 757377

ARMed Forces BBS

Chris Claydon's ARMed Forces Multimedia BBS located near Winchester in Hampshire, his showcase for the *RSDFS Immediate* multimedia BBS software package for Acom 32-bit computers, is now running with 24-hour public access on all speeds to V32bis (14,400bps). You can call with a normal ANSI/Zmodem comms terminal such as *Hearsayll* to download the free *Immediate* slave package. Chris claims that all FidoNet and Usenet conferences are available.

DTP

Fishy layouts get a makeover

THE first victim of a makeover turned up all too eager to go under the knife. *Robin's Reed* is a quarterly newsletter for the Nottingham & District Section of The British Koi Keepers Society. The A5 pamphlet-style newsletter is laid out by Adrian Grigg on what he describes as a modest setup – an A5000 with 4Mb. It has a printed colour cover with black only pages. It runs to about 50 pages and is printed professionally thanks to a friend of Adrian's in the trade. Adrian uses *Impression Publisher*, *Draw* and a hand scanner. The pages I've made-over show the tail end of one article and the start of another.

The changes

To make the blocks of text look darker and somewhat denser, I changed the body font from 12pt Trinity to 12pt Bembo. I also added a paragraph spacing to help break the text up, but removed the initial indents as they didn't go too well with the spaced paragraphs.

The headlines and subheads tended to blend in with the copy so they were changed to a sans serif font and increased in size to make them easier to read. Some spacing was added top and bottom to separate them from the body copy. I used GillSans and altered the aspect ratio for the headlines to 75 per cent to make them look tall and thin. I also added a deep sink to the top of the page, adding white space around the headline to draw your attention to it.

The new master pages included the graphics, page numbers and rules, but only contained guide frames since space is limited on an A5 page. It's therefore often easier to draw frames as you need them and link them manually.

The original used the basic single A5 page with no regard to left-right page pairs. The new master pages use mirror imaged left and right layouts. The columns containing the main copy were moved in from the outer edges of each page to allow for thumb space, and this space can still be used to flow graphics, captions or quotes into because they can be obscured by your thumbs as you hold the newsletter without covering up any of the copy you're reading. I added some prominent sub-heads and the prominent headings to help provide cues for readers.

The photograph was lightened to make the contrast with the text less hlatant and help retain detail hy preventing fill-in. It was also made smaller to prevent it dominating the page. The chart was re-drawn and made a bit smaller; the grey bars help when tracking data across the columns.

Steve Powell

The overall look of the pages is very text-heavy. The graphics tend to look very dark or very light compared to the areas of text on the page.

A repeating graphic on each page maintains the theme of the newsletter and helps with continuity from page to page. The extra line along the bottom was added to offset the much darker headlines at the top of each page and to frame the text.

Jargon notes

Cues are things like headlines, quotes, captions, subheads and such like which the reader can use to navigate round pages. It tells them what the main copy is all about without them having to read it. The body copy is the main block or blocks of text on the page. The sink is the space at the top of the page before the top line of copy.

Master pages are the templates that Impression uses to describe common features like the graphics and frames that will appear on every page in a document. They can be used to give a uniform look to a document, which is usually lost if you design each page from scratch. Fill-in can occur when too much ink is applied to the page when printing. The very dark areas become solid black because the ink spots merge and details are lost. Making photos lighter and adding contrast can help prevent fill-in and maintain detail.

Demos galore

DEMOS certainly aren't everyone's cup of tea, but the ability to produce unusual computer graphics on your own machine remains a popular interest for coders and demo watchers alike. There's been a hit of a lull in the demo scene over the last few months, but fortunately a range of new and old groups has produced quite a glut of demos for review in this month's PD page demo special.

Before I get down to some serious pixel pushing and vector spinning, a word for the beginners among you. What are demos? A demo program represents a fusion of programmed code, graphics and music which produces a rolling demonstration that shows off the authors' skills.

The idea from a demo group's point of view is to produce a program that is both technically impressive (in order to impress the coders in all the other demo groups) and well presented and interesting to watch (for the non-programmers among us). First up from the range of demos

before me are a couple of older productions from the continent that have only just made it across to the UK. The Demo and Terrademo are fair representations of some of the most boring demos to appear on the Arc in the last few years sequences of effects that aren't linked, require us to press space alter each effect, and use endless scroll texts that go on for hours. To add Metamorphosis by Zarquon, featuring a mouse-controlled menu insult to injury, Terrademo and some texture-mapped 3D buttons which give this an imprescontains music that was originally used in an Amiga

demo, before then being used in a Bytepool demo on the Arc. Is it too much to ask for some new tunes?

A much more recent demo by Sounds Riscy is no better, with terrible music and pretty useless coding. Fortunately, the version I saw is 'not yet ready for

distribution'; let's hope they start again before releasing it.

sive look.

MetaMorphosis by Zarquon is a relief to watch after the last three demos. It's a small but very nice production making use of texture mapping, and some nice effects linked together with a little mouse-controlled menu, reminiscent of the routines used on the latest Silicon Graphics windows. Check this one out, but you'll need an ARM3 to appreciate it fully.

From here on things can only get better, with two fantastic releases from Germany. Xcentric and Ostern95 are examples of the way the demoscene on the Arc is headed - fast moving, interesting effects which have no problems holding your attention.

With Xcentric, presentation is to the fore, but it's a bit of a shame that it's aimed solely at ARM2 machines. Having said that, the coding is excellent and has been combined to great effect with some superb graphics by Marc Andreoli of Alderbaren fame, None of

the effects seem to drag out too long, and all are very impressive, given the lack of ARM2 speed. TXP has excelled, definitely achieving its aim to produce the best ARM2 demo. I'm now looking forward to the next production which will be Risc PC only.

Ostern95 shows where the scene should be headed. It's fast, snappy and has great presentation. Ostern is the result of three days' coding at the 'Fried Bits Eastern Coding Convention 3' and is a collaboration between three groups, including the well-known Slompt. It's not very big, but it doesn't have to be. The first effect warps a logo on to the screen in a couple of seconds and looks fantastic,

Despite Xcentric's overall excellence, I liked the style of Ostern - lets hope they do it again next year. There's only one major criticism of these productions - the fairly average music. Where are those Arc musicians?

It looks like Germany has maintained its lead on the demo front, but the UK isn't far behind. The recent Slipperv Slideshow release by Dizzy Wizard has some great graphics and demonstrates the potential of a new group on the scene. Another new UK group, with the bizarre name of the 'Nutters', is also looking very promising. Fronted by two coders and a plethora of artists, its first demo should be one to look out for. I'll keep you informed.

All demos reviewed are available from The Datafile or online on Arcade and Digital Datahank BBSs.

Contacting me

You can contact the PD page by writing to me, Paul Wheatley, at Acorn User, IDG Media, Media House, Adlington Park, Macclesfield, SK10 4NP. Or preferably, by e-mail to quantum@digibank.demon.co.uk or online on the Arcade BBS.

Ostern95, an excellent demo from German coding groups Archiologies, Icebird and Slompt.

Coming um... sometime soon now...

Slippery Slideshow by Dizzy Wizard Software - anarchy in the UK?

Business

NEVER say that no-one listens. Back in the Business issue (last August) we wrote that 'the absence of Novell compatibility to the Acorn world is a major drawback to commercial users. Until an Acorn can sit on the same network as and share resources with PCs, this will continue to be a problem.'

A year on, and not only can we connect onto large PC networks (with Acorn's *Omniclient*), but we can also connect PCs to *Acorn Access* networks (with KCS' *Arcshare*). Furthermore, an increasing number of programs can import and export using 'industry standard' file formats.

Arcshare has only just been released and I expect it will be popular with small businesses. Now, companies with just a handful of mixed machines can share files without running around with discs. What's more, Acom Access is a 'peerto-peer' system so no dedicated file server is required. Arcshare

| reinole. lwk e | irewrkz | * |
| List Files ol Type: | Drives: | |
| Fireworkz doc (*. lwk) 🗄 ± | d: | * |

If you're unfortunate enough to use Windows, you'll see plenty of dialog boxes like this (no '-ue'). RISC OS users simply double-click on file in a directory display. But there's one thing that can be said as a plus for both systems of loading files. With ArcShare or Omniclient, each operating system can access the same files from networks.

is a piece of Windows software which, in conjunction with a cheap Ethernet card, allows PCs to plug into *Access* networks with no hassle.

Acorn users can load and save all the important graphics, spreadsheet and database formats. There will probably be readers shaking their heads at the mention of database format, but all good PC databases load and save CSV (comma separated variable) files. The same applies to RISC OS datahases. There is a reason why CSV is not suitable for transferring spreadsheets – formulae aren't kept. But how many name and address databases have formulae in them? Of course, if you want to transfer actual database applications rather than just data, dream on...

Kimberley Computer Services Tel: (01942) 677777

Spreadsheet – power or ease of use?

REGULAR readers may have guessed that I use *Fireworkz Pro* (£149) as my spreadsheet. It's powerful, has an attractive button bar and gets regular updates. Does it really matter if the check-as-you-type spell checker beeps when you type *correct* words?

However, *Fireworkz Pro* is far from offering white simplicity – changing the font and other effects is a pain (see AUMay 1995). When questioned on whether the effects system was intuitive, one employee at

TableCalc – low on features, but cheap and easy to use.

Colton replied 'very.' On the other hand, Mark Colton thinks it is a little old now and we could well see a new design.

In the iSV Products camp, there is a product which is simple to use. It's called *TableCalc* (£31.50). It doesn't have names or custom functions, or graphing or dragand-drop; what it does present is ease of use. In fact, it's ridiculously easy to use. Nicely designed windows and a save dialogue box identical to the one in the RISC OS Style Guide

(see picture) make this delightful to use, Whatever *TableCalc* lacks in features it more than makes up for in its low price and interface.

Clares' Schema (£114.89) is often criticised for heing difficult to use. This is utter nonsense. It has a revolting button bar (though if you picked up the July issue, you will have some nice-looking replacements). More importantly, its menu structure and dialogue boxes are very easy to use, if a little rushedlooking. If *Schema* had a little more control of page layout and Clares draughted in a Style Guide fanatic, it could become a best-seller.

As for *Eureka* (£119), it is a spreadsheet which people seem either to love or hate. Very similar to Microsoft's *Excel*, it is definitely the best solution for those with a mixed computer environment. I would not recommend that users purchase the PC version of *Fireworkz* as I have found it unbearably bug-ridden.

Learning to type

It's a sad fact that most office workers can't touch type. I have to profess I can't either. *Touch Type* from lota Software is the bestknown learn-to-touch-type program for RISC OS and is probably the finest. A new version is in the pipeline for early next year which will allow users to pick the keyboard layout their machine has – including the standard British layout which the Risc PC has.

> lota Software Tel: (01223) 566789 Fax: (01223) 566788 E-mail: admin@iota.co.uk

Bitz and bobz

Colton 'Z' users among you who want to change the icons on the button bar and items in the menus should look at a couple of files in a text editor. They are *!Appname.Resource.Config* and *!Appname.Resource.Choices.* Choice18. If, on the other hand, you would prefer to get rid of the loading screen, delete the file *!Appname.Resource.ISprite.* Before you do anything, make sure you have a backup just in case.

Finance manager

A new company – Solloway Software – has released what it claims to be a 'powerful, flexible accounting application for personal, home or club accounting'. *Finance Manager*, as it is called, is fully editable like Apricote's *Personal Accounts*, has similar features, but is organised differently.

My advice to potential purchasers is to ask both companies for an information pack and decide for yourself. Competition is always good and this should spur on some rapid development from both companies.

Education

Sherston now listens

SHERSTON'S Talking Books and Talking Topics have proved to be very popular and, more importantly, very effective. Its latest project is a speech recognition system for schools which will form the basis nf Listening Books. The system is based on an original speech recognition system called AURIX. developed especially for children by the Speech Research Unit of the Defence Research Agency. Sherston

and the DRA are working together to produce a commercial system for schools by January 1997. Until now, all speech recognition was for adults, but children have very different voice patterns. The hardware for the system will probably comprise a printer port key, headphone/ microphone pack and an interface box. The disc-based talking/listening book software will contain speech patterns of all the words used in the story. The children will he able to read the text, listen to the words, and then be able to

Talking books like this could soon be listening too.

speak back to the computer which will assess how accurately the words have been spoken.

This. I believe, is a significant advance in computer software, with almost endless possibilities. The obvious one is for Key Stage 1 and 2 children who are learning to read, hut possibilities are also opened up for special needs children and students for whom English is not their first language.

Sherston will be developing software for their speech recognition system but are also planning to make it available to other software houses, although the licensing details have yet to be worked out.

Bill Bonham commented: 'This really is a very exciting progression in educational technology. I am sure the potential for education is enormous and am thrilled that Sherston Software has the opportunity to play an integral part in such an important development.'

Sherston Software Ltd Tel: (01666) 840433 Fax: (01666) 840048 E-mail: info@sherston.co.uk

Spex augmented

Aspex Computing has released Spex+ - a significant upgrade to the very successful design program Spex. The new version includes many enhancements including improved compatibility with Aspex's other CAD program, ArchiTech. Of the many new features, one of the most significant is 'snap to object' which enables the user to more easily position objects side-byside. Existing environments are fully compatible with SPEX+, and more environments are expected shortly. The upgrade price from SPEX to SPEX+ is £14.95, and the outright price of SPEX+ is still an amazing £99 for a full licence.

> Aspex Computing Tel: (01822) 611060 Fax: (01882) 611061

Headphones to the rescue

Thank you for the several letters I received about the increased amount of computer-generated sound in the IT rooms. A couple of people came up with a manufacturer of 'indestructible' headphones which are available through most county suppliers.

Ivan Howlett of Chesterton Community College supplied a neat solution for eliminating the need for students to grope around behind the computer to plug in headphones. For each computer he simply purchased a one metre headphone extension lead for about £1.30. This is plugged into the back of the computer and the socket on the other end of the lead is secured to the leg of the table by drilling a hole in the leg exactly the same size as the socket, and force fitting the socket into the hole so that it is just visible from the front. Thanks Ivan.

Contacting me

You can contact the Education page by writing to me, Geoff Preston at Acorn User, IDG Media, Media House, Adlington Park, Macclesfield SK10 4NP or by e-mail to GPreston@arcade.demon.co.uk.

How's it done?

SEVERAL people at the Acorn World Show commented on the lapel badge I was wearing which, although laser printed on card, appeared to have a metallic finish on the words 'Acorn' and 'User'. The certificates presented to the competition prize winners were the same. So, how's it done? Well, it's a product called Laser Colour which is available from Paper Direct. To apply colour you begin by printing a document on a laser printer in the usual way.

The Laser Colour is in the form of a film and comes in either a roll or as A4 sheets. A piece of the film is cut to cover the print you want coloured and is held in place with 'low-tack' self-adhesive stickers. The sheet is then inserted into the printer again and a blank document is printed.

The printer's heater remelts the toner, and the colour from the film is bonded onto it. Remove the film and the colour remains on the

parts the film once covered.

Laser Colour is a fairly easy material to use, although care must be taken not to handle the surface that will bond to the toner. A very sharp knife is required for cutting and the self-adhesive stickers must not be positioned over an area which is to be coloured, nor should the Laser Colour film be positioned over an area which is not to be coloured.

Paper Direct Tel: (0800) 616244

ades

Portables

Blowing bubbles

THE two newest editions to the Canon BubbleJet range – the BJ-30 and BJC-70 – have both been designed with the portable user in mind. The BJ-30 is the replacement for the popular BJ-10 while the BJC-70 is an all-new colour model. Both measure a minute 300 x 157.6 x 57 mm and weigh a mere 1.4kg, have an integral 30 sheet paper feeder, offer LQ and BJ emulation and resolutions up to 720 x 360dpi.

The BJ-30 has a print speed in the region of 2.5ppm (text) and 1.5ppm (graphics). The print quality, especially at 720 x 360dpi, is excellent and the banding effect common on many bubhle jets is barely noticeable. The black cartridge is separate from the printhead and will do about 130 pages before needing to be replaced. This is a very simple joh as the ink tanks simply click in and out of the print head. At a cost of around £14 for three cartridges, the BJ-30's running costs are one of the lowest for any bubble jet.

The BJC-70 offers all the leatures of the BJ-30 but has an increased mono print speed of 3.3ppm (text) and 2.2ppm (graphics) and also full colour printing with a true black. The BJC-70 has an interchangeable print head, one designed to hold a large black cartridge and another which holds both a three colour and black ink cartridge. The colour output of the BJC-70 is excellent, especially when using Canon's coated or glossy paper and compares very favourably to the 720 x 720 dpi output of the much larger (and more expensive) Epson Stylus Color.

As expected, both printers work very well with the A4. Print quality using Acorn's BJ-10 driver is excellent, although I really would recommend upgrading to CC's *TurboDrivers* as the speed increase they offer, without sacrificing quality, is amazing. Both models would make an ideal companion to the A4 but I would highly recommend that, if you can afford it, you buy the BJC-70.

If you are a Pocket Book user, the BJ-30 has to he the machine for you, unless you have a need for colour on another computer. The BJ-30 allows you to print in LQ or BJ emulation – the Pocket Book can handle both – although my advice is to opt for the LQ emulation. This allows you to use most of the BJ-30's internal fonts at various different font sizes and by using the Pocket Book's graphics set simple DTP is possible.

Having used the BJ-30 and BJC-70 for three weeks in various different situations, I have hecome a great fan of both printers. They are ideal for any Pocket Book or A4 user, being economical, fast and. if the BJ-10 is anything to go by, very reliable.

Canon UK Tel: (0500) 246246 Computer Concepts Tel: (01442) 351000

SoundMaster compatible

Included in the Psion 3a and Pocket Book 2's application suite is a recording facility which, until recently, seemed to have little use. However, this could all change with the launch of a sound sampling package from Psion. *SoundMaster* is able to manipulate your samples in many different ways and a large number of effects are possible.

The package is supplied with 50 extra sound samples, from classical pieces to car horns and slamming doors, all of which can be copied into your sample. The program costs £24.95 inc VAT, and I hope to be taking a more detailed look at it in the near future.

> Psion plc Tel: 0171-262 5580

Downloading

I recently received a letter from a reader who is experiencing problems downloading software from The Datafile's PDCD1 and it occurred to me that many other people may be having the same problem.

The answer is to load PocketFS and then use the 'Open S' menu option, This will bring up a window containing two or more directories, one of them called M. Double-click on this directory and then on the APP directory and place any applications in here. Then on the Pocket Book use the 'Install Application' option – select the program you wish to install and then press Enter. Your program will then be installed.

A rich Ovation

Ovation users currently suffering from depression due to the program's inability to import RTF files will be pleased to here that its rather impressive looking replacement, Ovation Pro will solve all your problems, when released.

Beebug Ltd Tel: (01727) 840303

Plantwise demonstration

THIS is a demonstration of Sherston Software's innovative multimedia program which shows the inner workings of plants. It is fully-working, but only contains a fraction of the data of the full version. Even though it is a cut-down version, you can get a good idea of the care and detail that have gone into the programming. The two topics that have been included are the 'leaf' topic in the structure section and the 'seed dispersal' topic in the reproduction section.

To see what topics have been included, click on the 'Fast find' button on the tool bar. Those topics available have an orange background. The 'What word?' hutton opens a window showing all the technical words associated with the topics, and giving definitions of them.

In the demonstration version, this list is naturally restricted to those topics included. The icon bar menu allows you to choose whether the labels accompanying the topics are worded simply or at a more advanced level.

The full version of *Plantwise* is available from Sherston Software at a cost of $\pounds 44.95 + VAT$. See the *lReadMelst* file in the archive for more details.

Plantwise will work on all versions of RISC OS, from RISC OS 2 upwards.

ClicBack

THIS Careware program is a fully-featured hard disc backup utility. It recently won the APDL Shareware of the year award, and has been recommended on the Questions and Answers pages of *Acorn User*. Among its many features are:

Full or incremental backup available.

• Back up to floppy, Syquest or another hard drive.

• Variable data compression rates when backing up the drive.

• Retrieval of individual files from the archive.

• Parts of the hard drive – directories or files – may be backed up or excluded from the backup.

· Option to verify the data as it is saved.

Given the list of features of *ClicBack*, it is remarkably easy to use. Install it on the icon bar and click on the icon to open a window. Choose the drive to be backedup and the drive to store the backup, either by typing into the writable icon, dragging a file or a directory to the icon or using the pop-up menu for the destination. If a file is dragged to the writable icon the path-

a to the writable icon the pathname of the directory containing the file is entered. The window will also set the type of backup required and whether it is a full, incremental or differential backup.

The pop-up menus in *ClicBack* are slightly nonstandard, in that you have to use the Menu button on the mouse to open them – you cannot use Select as you would normally be able to. If you run *ClicBack*, quit and then try to run it again, you may get the error '*Clicback* is already running.' If you do, then run the *ClicBack.'Boot* file, which should reset the relevant system variable.

Be warned that if you perform a full backup on a hard disc of any size this will involve a lot of floppy discs and disc swapping.

For more information on running *ClicBack*, consult the comprehensive *!Help* file. Interactive help is also supported.

Because *ClicBack* is Careware, if you find it useful you should register. Money from registrations goes towards the Cancer and Leukaemia In Childhood Trust (CLIC). a registered charity. Registration costs £10 – please send a cheque or postal order payable to 'Steve Spry' to: Steve Spry, 36 Moreton Avenue, Bideford. North Devon EX39 3AY, along with a blank formatted disc. More details are in the *!Help* file.

Both *ClicBack* and *ClicLogs* should be copied ont of the archive onto another disc before use, as the program will attempt to write information hack to them when it runs. *ClicBack* needs RISC OS 3.1 or greater to run.

Regular features

Various authors

THERE is also the standard range of items on the disc which tie in with articles in the magazine:

• Our ever-popular C tutorial this month reaches linked-lists, a fascinating way of storing data perfectly suited to illustrating the use of pointers with structures. Study the program closely; all uses of pointers in C can be confusing if you're not used to them, but pointers when used with structures are cspecially hairy.

• In the *Education* directory, you will find a *Junior Piupoint* file by Colin Rouse. The file is a sample questionnaire, as described in his *Junior Pinpoint* review in the magazine, and needs *Junior*

Pinpoint to run it.

• Mike Cook's latest incarnation of his *PortMon* program is in the *RunTheRISC* directory, as he exchanges new ports for old on pre-A5000 machines.

• That old faithful *INFO section is still going strong. There's a neat little utility to give your machine a name, another annoying *Tetris* variant, a module to swap your mouse buttons round – guaranteed to break the ice at parties – and a program to generate pictures which need to be viewed with a tube of foil; foil not provided.

by Sherston Software

Lorem Ipsum

LOREM IPSUM is – to quote the *!Help* file – unadulterated drivel. It is pseudo-Latin designed to create text that 'looks right' but which in practice is meaningless. The text is arranged in sentences with paragraph breaks, just like normal text.

This does admittedly beg the question: 'Why?'

Actually, it's very useful for DTP work. If you are designing a page layout, you need a hlock of text to test that the design looks right. Obviously, you can write some yourself, but this suffers from the problem that you will have to write at least one and preferably several pages of text to get enough variety to really test the design. What you really need is a program to generate any amount of correct-looking text – you need *Lipstum*.

Lipsum installs on the icon bar like any other application. Clicking on the icon with Select opens a window containing a number of options and a text file icon. When this is dragged to another window, some *Lorem Ipsum* text is sent to that application or (if it is a Filer window) saved to a file. The amount of text generated is controlled from the options in the *Lipsum* window; a friendly window pops up once the text has been generated to let you that *Lipsum* has done it.

Lipsum is very straightforward to use, although there are some

Cover disc news

WE at Acorn User are very sorry to report the break-up of the Insight programming team responsible for HomeWorks. Both programmers have now moved on to other jobs within the Acorn market that do not allow them the time to continue developing the program.

For this reason, there will unfortunately not be any further parts of *HomeWorks*. *Acorn User* apologises to all our eager readers who were awaiting the database and word-processor modules. We had hoped that the programmers might be able to finish them, albeit more slowly, but this has not proved to be the case.

Apologies also to everyone who was trying to find the *StarFighter 3000* codes on the cover disc of the last issue – they were inadvertently missed off. Sadly, no one noticed this until after the magazine had heen in the shops for a week, by which time this month's disc had been sent off. They will appear next month – honest!

Chris Taylor – who wrote the *MacroLife* program on the July cover disc – reports that he has now made it RISC OS 2compatible. Interested readers should contact him at the address given in that issue of the magazine.

Chris Jordan of Hybrid

Technology has revealed that there are a few full manuals for *Elite* still available on a first-come, first-served basis at £10 each. Commanders who want the full manual, trading record pad, ship ID cards, key strip, colour poster, registration card and shirt order form should send £10 to Hybrid Technology, 1 Winship Road, Milton, Cambridge CB4 6BQ. But hurry – stocks may not last long!

problems saving text direct into another application on the Risc PC. If you have trouble, simply save the text to a file and load it into the application in two separate operations. *Lipsuut* requires RISC OS 3.1 or greater to run.

Disc information

The majority of our survey responses suggested that readers wanted more software packed on the cover disc. In order to do this, we have removed the *Menu* program.

RISC OS 3 users will normally be presented with the usual display of icons; they can open the archives by double-clicking upon them (this is the equivalent of the 'View' option in the *Menu* program). To get help on an archive, RISC OS 3 users should choose Help from the App. 'Appname' submenu obtained by clicking with Menu over the archive icon. If *ArcFS* is included in your boot sequence, you will need to run it

before the archives are displayed as applications, though they will open as normal archives.

RISC OS 2 users will have to work slightly harder. They should first run ArcFS, which is the program which uncompresses the data in the archives. Double-clicking on an archive will open it, revealing a *!Help* file, a *!Run* file, a *!Sprites* file and a directory containing the archived data. Loading the *!Help* file into a text editor will give information on the archive contents.

If your disc is faulty, then you should either return it to TIB, TIB House, 11 Edward Street, Bradford, Yorkshire BD4 7BH (if it does not verify or is damaged) or to the editorial office at *Acorn User* (if it verifies). The *Acorn User* cover disc has been checked for viruses using *Killer* version 2.002 from Pineapple Software.

SENLAC Computing

PO Box 304 Brighton BN1 1LE Callers by appointment Tel: (01273) 208074 Fax: (01273) 738258 e-mail: pete@senlac.co.uk Compuserve: 100113,603

Big news this month is the launch of Acorn's new A7000 and the second generation of Risc PCs. Prices

are, of course, as good as usual. One or two people have shown concern that we don't make it clear enough that our prices include VAT so it can look as though we are dearer than is really the case. OK thea...

"All our prices include VAT and UK mainland delivery. WHAT YOU SEE IS WHAT YOU PAY!"

If you run a school or business don't forget that our leasing scheme offers an easy way of obtaining your computer(s) and if you are leasing a Risc PC you can still take advautage of our extra cash/cheque discouut.

PC Card: Don't forget that we are also PC dealers so are in the best position to offer you the keenest deals ou PC software including the amazing Xara Studio from the Computer Concepts stable.

Of course, it's impossible to list everything in an advert this size so if you don't see what you want, please call.

Dear SENLAC Computing, PO Box 304, Brighton, BN1 1LE, I wish to order these items from you. I'm glad that I don't have to pay any more for UK postage and packing and that the prices you quote include VAT. Item £

New machines from Acorn

here's a new machine in the Acorn town, and the one-year-old Rise PC has been given a birthday makeover. That's the welcome news from Acorn this month. The A7000 (codenamed Kryten during development) is hased around the ARM7500 chip, and is in essence a Rise PC with no VRAM or co-processor slot, and reduced expansion capabilities. The Risc PC 600 now boasts full 16-bit sound as standard and a newer version of RISC OS (which comes in all the machines) in ROM. The new Risc PC 700 is similar, but has a fast ARM710 chip inside.

There are a few enhancements common to all the new machines. All of them have: • RISC OS 3.6 (see separate hox for details)

16-bit sound as standard

· an on-board mixing point for CD, internal, and external sound which could be seen as raising them to the standard the Rise PC should have been at when it was originally released.

The A7000

Acorn's A7000 machine can be considered as replacing the A5000. It is pitched between the A4000 - which is still in production - and the Risc PC. It follows the philosophy of the A3020 and A4000 as it is based around a single chip which combines the functions of processor, VIDC, MEMC and I/O chip, in this case the ARM7500.

This leads to an extremely compact design of computer. The circuit board for the A7000 contains the ARM7500, two ROMs with RISC OS 3.6 on, sockets for up to 8Mb of RAM. a SIMM slot for extra memory and a slot for an optional backplane. Aside from a few other connectors, that's pretty much it. Although the circuit board on the A7000 is the same size and shape as the Rise PC - and the connectors on the back of the machine are in identical places, meaning that either board can in principle sit in either case - the machine itself is smaller. It's also more robust,

The long-awaited new machine from Acorn has finally arrived in the shape of the A7000. The Risc PC has also been updated with two new models. David Matthewman reveals all.

rvten

ename

having been designed to survive seven years of continuous abuse in schools.

The main leatures of the A7000 are as follows:

32MHz ARM7500 processor.

 16MHz memory, running off the halved clock signal from the crystal

that drives the processor, However, a second crystal can be added, allowing the memory and processor to run at different rates - a 40MHz ARM7500 processor is not ruled out.

 2. 4 or 8Mb of RAM soldered onto the motherboard, with one SIMM slot able to take a Risc PC-style SIMM upgrade up to 128Mb.

 A single 27pence speaker for sound output, better - and louder - than the 21pence one in the Risc PC but still no substitute for connecting speakers to the jack socket in the hack of the machine.

• Either a 32-bit expansion card or a 5.25in hay to hold for instance - the optional ATAPI IDE CD-ROM drive. The 32-bit expansion card has an EBI slot to take standard podules, though with no DMA as there would be on the Rise PC

 A bi-directional printer port. and a serial port offering speeds of up to 115,200bps, port's performance has been improved.

 Keyboard connection as on the Risc PC. · An IBM PS/2 mouse, not a Quadrature mouse

· A network socket as on the Risc PC,

The A7000 boasts a compact and robust design. The ATAPI CD-ROM drive shown here is optional - the A7000 can take a single expansion card, but only if it has no CD-ROM drive, as as on the Risc PC. The printer they occupy the same physical space inside the machine.

slot for networking. Acorn's Access+ software comes on the hard drive, and Access is now built into ROM. The network socket may he used instead to connect PC-style analogue joysticks.

• A Connor 425Mb IDE hard disc on the more expensive models.

• One (and emphatically *only* one) floppy drive.

• No VRAM or second processor possible, and the ARM7500 chip cannot easily be upgraded.

All this adds up to a very nippy machine. While the A7000 is currently aimed fairly and squarely at schools, there is a lot to attract the home user and small businesses. The A7000 is between three and four times faster than the A4000 - in fact it is slightly faster than existing Risc PCs with no VRAM. The VRAM, in any case, only helps the Risc PC in high-bandwidth screen modes. The lack of VRAM on the A7000 is also noticeable in the range of Desktop modes available; 32 thousand colour is only available in 640 x 480, and 16-million colour not at all. 16-million colour modes are, of course, possible outside the Desktop and, as on the Rise PC, the palette in 256colour modes may he varied throughout the 24-bit colour spectrum.

For anyone who does not do extensive graphics work, does not need a co-processor and will not use several hardware add-ons, the A7000 could be the ideal computer. Remember that either a CD-ROM drive or a SCSt adaptor can be added to the printer port, so the relative lack of expandability is not quite as restrictive as it appears.

Faster Risc PCs

Possibly the biggest surprise in the list of new machines from Acorn is the new Risc PC 600. Far from heing content to let this machine continue as it was, Acorn has improved its specifications. In addition to the improvements given at the start of the

Scratch off the '6' and add a '7' ... actually, there is slightly more to the new Risc PC 700. Note the new operating system: RISC OS 3.6.

article, the Risc PC 600 now has:

• 4Mb DRAM as standard (no VRAM).

• A 425Mb IDE hard disc.

• A faster (33MHz) ARM610 processor.

This makes it a slightly faster and far more expandable machine than the A7000.

Its big brother is the new Risc PC 700, similar in specification but containing an ARM710 processor clocked at 40MHz. Those who were waiting for the ARM700 and FPA will have to wait a while longer unfortunately, as technical problems have delayed this card, probably until the end of the year.

The ARM710 will be available to existing Risc PC owners as an upgrade for $\pounds 100 + VAT$, probably around the end of August.

The Risc PC 700 comes in two configurations. One has 4Mb of DRAM. 1Mb of VRAM and a 425Mb hard disc; the other has 8Mb DRAM. 2Mb VRAM and an 850Mh hard disc.

When can I buy one?

The products should he available during the last two weeks in August. As with the Rise PC, there will probably be a waiting list, so the earlier you get your order in, the earlier you stand a chance of the machine arriving on your desk. Education customers should note that a change in how machines may be purchased is

RISC OS 3.6

The A7000 and the new Risc PC models are all now fitted with RISC OS 3.6, an updated version of the operating system. This comes on two 2Mb ROM chips and contains a number of enhancements even over RISC OS 3.5 which was fitted to the original Risc PC. RISC OS 3.6 needs fast backing store to operate, so the machine must either be connected to a network or have a hard disc. Major changes are as follows: Improved FileCore: the filing system in RISC OS 3.6 can now address larger hard discs, theoretically up to 4Gb for an IDE disc and up to 16Gb for SCSI. Previous releases could not address more than 512Mb, so this is a substantial improvement. However, the ten-character filename limit and 77-file limit in a directory remain as limitations.

Applications in ROM: as with RISC OS 3.1, the standard applications – Edit, Draw, Paint, Alarm and Help – are in ROM rather than on the hard disc. In addition, Printers is in ROM, although of course individual printer drivers will still need to be loaded from disc. Paint now has full support for deep sprites and will convert JPEGs to sprites. The *Draw* module will load and render JPEG files extremely quickly, resulting in a great saving of space because the files only need to be held in memory as JPEGs, not full uncompressed bitmaps. *Paint* obviously cannot perform the same trick, as pixel-by-pixel editing on JPEGs would mean uncompressing and re-compressing the image on the fly each time a change was made. **Toolbox modules**: the *Toolbox* modules distributed with the latest Acorn development system are also built in to RISC OS 3.6, representing a large saving in memory when running a program which uses them. **Networking**: RISC OS 3.6 comes with *Acorn Access* built in, including a long overdue TCP/IP stack. This makes plug-and-play networking simple – just slot in a network card.

The question on the lips of every existing Risc PC owner is, of course, 'Can I upgrade to RISC OS 3.6?' The answer from Acorn is 'Yes, but you'll have to wait until 1996 at the earliest.'

FEA

(2) The A7000Net comes with built-in networking card but no hard disc. It must be run as part of a network.

(3) The A7000 and the new Risc PC 600 range can have an optional IDE CD-ROM drive fitted for £100 (REP) or £111 + VAT (RRP) extra.

Pricing for the machines

Acorn has released the new machines at a competitive price, and has lowered the price of its existing models accordingly. In line with its new policy of aggressive pricing for the education sector, the machines are available at a lower price (the REP) to that sector. Note that the REP is *lower* than the price Acorn will sell to dealers, so there's no use asking your dealer to match it – it's only available direct from Acorn and Acorn's Education Agents to *bona fide* Acorn education customers. All the prices quoted below exclude VAT.

Notes:

(1) The AKF52 is a low-resolution 14in monitor – the high-resolution AKF50 is typically £40 more. The AKF60 is a high-resolution 14in monitor; the 17in AKF85 is available for the Risc PC range for £250 (REP) or £280 + VAT (RRP) extra.

reported on the news pages - if in doubt, contact Acorn.

Acorn intends to build 6000 A7000s between now and the end of the year, which should hopefully satisfy the immediate demand for the machines.

The rest of the range

The A7000, while clearly a cut-down Risc PC, is not perhaps as cheap and lowend as many people were expecting. This is reflected in the fact that Acorn continues to sell A3020s and A4000s, though it has reduced the price of both. Cheap A3010s are still available as well from many dealers, and the A4 still nominally keeps Acorn in the portables market.

This reflects the relative longevity of Acorn technology. The older machines are neither laughably slow nor unable to run most modern applications, as would be the case with similar-aged PCs. Both the A3020 and the A4000 sell well, and will probably continue to do so despite the release of the A7000. They should currently be regarded as the low-end Acorn machines. Acorn claims to have no plans to replace them, saying there is little scope for cutting the price of the A7000 much further.

A portable based on the ARM7500 is another matter, as the A4 is clearly showing its age. Will there be a prototype or a full machine on display at Acorn World? We'll have to go to find out, as Acorn's cards are very close to its chest on this one.

Product details

Your local dealer should have details of the new machines. Otherwise, contact Acorn

Tel: (01223) 254254 Fax: (01223) 254262 E-mail: info@acorn.co.uk WWW: http://www.acorn.co.uk/

The ARM7500 chip

The compact design of the A7000 is made possible by the custom chip designed by ARM and made by VL5I, the 0.6µ ARM7500. This 240-pin chip combines the functions of the ARM7, VIDC20 and IOMD chips all on a single chip, and has been used in the Online Media set-top boxes for a year now. It comes to the A7000 therefore as proven technology. A similar design - the ARM250 - was at the heart of the A3010, A3020 and A4000 machines. As was the case with them, it will not be possible to upgrade the A7000 with, say, a faster processor without removing the ARM7500 chip, which would not be easy. However, this should not really be necessary; at 25Mips the 32MHz ARM7500 is currently comparable to a 66MHz 486 DX2, so performance is

currently more than adequate. The chip will address up to 256Mb of DRAM, though the maximum possible in the A7000 is 136Mb. Among the features of the combined chip are: • ARM704 processor with Memory Management Unit (MMU), 4K onboard cache and 8-word write buffer.

 Video support for 24-bit colour (and incidentally for mono LCD and colour TFT-type panels, which could be useful if a portable version ever appears). The video, cursor and sound data reads all use Direct Memory Access (DMA).

• Two ports for P5/2-style 'keyboards', one of which will in practice usually be a mouse.

• Support for up to four PC-style analogue joysticks.

RISC OS 3.6 comes as standard in all the machines. The Acorn Access networking suite is now in ROM, and Draw includes direct support for JPEGs. Note though that the JPEG cannot be rotated, only re-sized, as the fast display routine for JPEGs relies on the image's being horizontal.

IMPROVE MATHS AND SPELLING IN JUST 15 MINUTES

These FUN EDUCATIONAL SOFTWARE PACKAGES were compared by The Times Educational Supplement with systems costing over £1,500 and they concluded: "If the National Council for Education and Technology's researchers ever got round to assessing the impact of a daily 15

1 270°E * 58 % 2 tier > 40°C. TOT 270%

Fast action learning from games

minutes with 10 out of 10 they would surely discover real improvements in Maths and Spelling."

If you have children aged 6 to 16 take this opportunity to judge the real improvements for yourself. Buy either MATHS or ENGLISH (or both) at just £4.99 each. The RRP is £25.95 each - A SAVING OF OVER £40!

These are brand new full versions, in attractive durable library boxes with colour manual and you are under no obligation to make any further purchases.

Versions of Maths and English are available on 3.5" Disc for: PC & Compatibles, Acorn, Apple Mac and Commodore Amiga. CD's are also available for PC & Compatibles.

FEATURE

Four years ago, two BBC Elite Commanders were allowed to flesh-out a dream: to write Elite for the Archimedes. One of them, Clive Gringras, tells all.

that ...

Warren Burch and I met in a computer shop called Fairhurst Instruments in Cheshire. Warren had recently breezed through a Computer and Electronics degree at Durham University; I'd just started my Law degree at the University of Sheffield, Within months of meeting we were churning out programs, each constructed with the same division of energy and skill. Warren was the main coder; I was responsible for the ideas and graphics. And out of that fusion eventually came ... Trojan, Trojan was a

three-dimensional space game with combat and missions. It was fast, colourful and championed the true power of the Archimedes, with one problem: Trojan simply was Elite. While Warren and his friend Stephen Pollard brainstormed amendments to prevent the game infringing the copyright in Elite, I mused on more legal solutions. I can recall the sound of Warren's jaw hitting the keyboard when I told him of my simple solution: we should write Elite for the Archimedes. After much negotiation with the authors of the BBC version, Ian Bell and David Braben, we were finally given the go-ahead. In May 1991, the twenty-hour days commenced.

Speed or style?

As mentioned earlier, Warren and I had different approaches to the same challenge. Warren would break down a task into logical portions, and then write the quickest, most efficient code to solve the problem. I was the dialectic opposite, Looks and feel were my main concern. This tension between efficiency and appearance, lubricated with black coffees and shepherd's pies, created the quality that Archimedes *Elite* was heralded for,

wrote

The favourite arena for these compromises was in negotiations about the front-end. In *Elite*, ships and other objects in space are represented by 'golf-clubs' superimposed on an elliptical grid, but how do you portray the 'golf-club' as moving over the elliptical grid? If the club is simply re-plotted each frame, the previous club will be left on the grid, creating a mess, so you must delete the previous

club first; there are two main ways to delete this old club. The quick pro-

cedure is to plot over the old club with the same shaped club, but in an EOR colour. For our purposes, this means that the grid 'underneath' the club is left unaffected and the club disappears.

Unfortunately if two clubs cross one another, the crossed area vanishes.

The slower method to delete the clubs is by brute force. Simply 'blit' out all the clubs. 're-hlit' the scanner and then draw in the new, moved, clubs. The testing we did on this suggested that it was at least five times slower than using the EOR method. However, when we saw the results of this slower method we were both convinced it was worth it.

The above quandary was not even in the same league as the irritation caused by the golden console itself. Although we knew that the scanner and readouts had to conform to the BBC *Elite* layout, we also knew that we should take advantage of the increased resolution and palette of the Archimedes. I designed about nine different consoles in *Atelier* – each as artificial as the last. By the time the sprite was compressed into the game, either I would have decided it was awful, or Warren would hate it.

We finally achieved this sought-after depth by chiselling out the centre of the console. This allowed ships and objects to fly slightly nearer without being 'clipped' by the top of the console. Again, it caused a slight speed loss because we couldn't simply blit the whole playing screen as a rectangle, but we were finally happy with the console.

For this reason the triangle-plotting routine had to be frighteningly fast. It was the time-critical aspect of the Archimedes *Elite*. Eighty two percent of game time is spent plotting triangles. Even with Warren's incredibly optimised triangle routine, it remained quicker to recalculate the position of 50 ships than to plot one small fragment of shrapnel. This was why the triangle routine was written in pure Assembler – it had to be rapid.

Of course, not all of Archimedes *Elite* needed to be written in Assembler, due to the 80-20 rule; 80 per cent of the computer's time is spent in 20 per cent of the code. There is no speed gain in using Assembler to plot, for example, trading information; C is vcry capable and the user will never know the difference. Believe us, apart from taking a further six months to program and debug. a 100 per cent ARM *Elite* would not have been perceptively quicker.

Ships that pass in the night

It is probably important to correct another rumour ahout Archimedes *Elite*. We didn't merely use the code from BBC *Elite*, tweak it and then add some colour to ships. The game had to be rewritten for two reasons. First, the code used in the original BBC version was very tight 6502 assembler, a far cry from C and ARM on the Archimedes. The second reason was self-imposed: we wanted to stretch the

Software developers

A number of alternative panels were considered, including this one with an 'organic' feel to it.

Archimedes to the limits those two Cambridge undergraduates stretched their BBC to in 1984. It would have been too easy to rewrite a game written for a 32K BBC for a 1024K Archimedes without altering the specification. However, we were of the opinion that Archimedes *Elite* needed more ships, more interaction and more realism.

The creation of more ships was achieved, primarily, with the use of Silicon Vision's *SolidCAD*, the most professional 3D modelling program in the Archimedes' market. Sculpting a 3D spaceship out of thin air is never easy; one must work in three separate views and attempt to keep in mind a representation of what the craft should look like on completion. With some kind reprogramming of the modeller thanks to Yunas Nadiadi, we were able to elfortlessly port these 3D creations straight into our game. All the three-dimensional shapes that appear in *Elite*, everything from the huge Generation Ships and Space Stations to the tiny Escape Capsules and Caimen,

Warren and Clive's original *Trojan* game, looking remarkably familiar. A number of things changed between *Trojan* and *Elite*; in *Trojan* you could fly straight through solid objects, engage reverse gear and even blow up the space station. Shame you couldn't do this in *Elite*!

were crafted with SolidCAD. We got so carried away with creating new ships, we almost ran out of snake names!

One feature we would have liked to have included in Archimedes Elite was point-of-light shading. The reason this wasn't included was not laziness or inability; the Archimedes' palette simply isn't large enough. Either we used 64 colours with. therefore, only four ranges of shade, or 16 colours with 16 shades. Both options looked shabby and less realistic than block colours, and we found dithering the colours looked messy.

This all being said, even choosing block colours isn't easy. One particular choice of colours almost started an argument. I had designed a new-look Boa called, in true Elite tradition, the Boa II sleek, fast and pink. But Warren objected to this colour. So strong was his aversion to pink that on one occasion Warren tried to compile the code without the ship. We finally came to a compromise that we would include on the Ship Datacards that the ship could be resprayed by Berch (as in Burch) Industries on Birera.

Interaction in action

Our philosophy behind Archimedes *Elite* was simple: the player should not be the centre of attention. To put this into practice, every object in space had its own mission. A ship's behaviour in space was out of our control as soon as the game's ship 'director' had selected them for inclusion in a particular

Thanks to...

Jez Swimer was an astonishing editor of the manual, especially as he didn't see the game until the manual was finished. For the actual layout of the manual, thanks go to Charles Moir at Computer Concepts for sticking in the Archimedes market and providing the fine DTP package, *Impression*. Appreciation must also go to the programmers of Acorn's Draw, which was used to generate all the manual's drawings, and to Rob Hamilton for providing an early version of Merc_lib for the Wimp Front-End. We must also thank Dr Lee Thompson who worked hard on an Elite tune that was sadly never included.

Help for the gameplay came from the able alpha-testing of

Commander William Moffet, Commander Rob Woodgate, and Commander Bob Redrup; the Missionary ships were dedicated to Bob's close friend, the Mad Hatter. Laser physics and space flight were explained by Prav (soon to be Dr) Patel. Many of the mission concepts and cute 'touches' came from Mat Tizard who, in respect, had Zartid m.t.a. named after him.

Obvious thanks go to Chris and Tony at Hybrid and lastly to the first ever *Elite* Commanders – Ian Bell and David Braben – for writing the ultimate space game. Even ten years on there has been nothing to beat *Elite*.

Where are they now?

For one reason and another, both Warren and Clive said goodbye to programming the Archimedes after finishing *Elite*.

Warren now lives with his wife and daughter in Seattle and works as one of the coders for Microsoft. He's been out there for almost four years now and loves it; he skis, flies a plane, rides his motorbike, hikes up Mount Rainier and still programs into the night.

Clive has just joined one of the largest law firms in London, called

Nabarro Nathanson. They sponsored him through Law Finals and a year as a Law Postgraduate at St John's College, Oxford where he concentrated on the licensing of software. He hopes, eventually, to specialise in Computer Law.

So, as you can see, they're both still very involved with computers, albeit 8000 miles apart. Still, that's nothing in their Cobra Mk IV...

David Matthewman

scene. For the first time in Elite, ships fought each other. Sometimes we'd fly out to the sun and see 30 or 40 pirates at war, only to be stopped by a hand of Police Vipers with their unique white lasers. We also introduced ships flying in formation: Missionaries in herds; Mambas huddled in groups to protect wealthy pirates: Vipers in sixes and sevens. The temptation was to pick off one Viper with a shot up the glowing boosters - less effective than one on the body, as the laser bolt is refracted hy the plume of the booster - and then watch the other Police gracefully break formation like ballet dancers. Unfortunately, this temptation wore off after we realised that five Vipers don't play fair after you kill one of their buddies.

Sorting the men from the boys

Our discussions with David Braben and lan Bell sometimes ended with lan or David saying a particular aspect of the game was quite tricky. Docking computers was a case in point; Ian said they should 'sort the men from the boys.' He was right.

The first hurdle with docking, as any Commander knows, is getting lined-up with the letterbox (opening slot) of the space station. This was achieved by marking a point out in front of the letterbox with an invisible buoy. However, liningup with the letterbox is the least of a Commander's worries; it's the 'boxing' or matching the rotation of the letterbox that really flummoxes.

We decided to imagine that there was one 'arrow' or vector sticking out of the right wing of the ship and one out of the left side of the space station. As the station rotated, the two vectors described the various positions of the hands of a clock. When the vectors pointed in the same direction, it was safe to dock without scraping the craft. Therefore we coded the flight program to minimise at all times the angle hetween the two vectors. Because the flight program actually manipulated the Cohra, the added bonus was that – if present – yaw boosters were utilised, and the player could still use the Cobra in case of trouble. Needless to say, the next communication from Commander Bell began. 'Hello *men...*'!

The programming of missiles was also demanding. If the missile flies too quickly it's no fun to watch and it's even less fun to avoid. If it flies too slowly it can be outrun. But that is only the half of it. If its maximum turn angle is too ohtuse, it can end up overturning and circling a target in simple harmonic motion like a fly. And if it can't turn enough, it can overshoot and never come back. So how did we solve this complex mathematical riddle? With the use of complicated vector algorithms? Intricate formulae? Well, not quite. We used that tried and tested scientific

principle of trial and error! By the time our missiles didn't overshoot and weren't too accurate we'd shot over a thousand of the blighters.

Before we're asked, yes, we did use a special Commander with infinite missiles. And, no, we won't be releasing that file.

Some things never change

There are two specifications that should never be changed for any version of Elite. We wanted to ensure that in Archimedes *Elite* the planets in the Galaxies and the trading prices on those planets adhered rigidly to those in BBC Elite. To do this we needed the actual code used hy Ian and David. But it wasn't as simple as that. The unseen difficulty was that the code that generated all this information was quite machine-specific, because the algorithms used were tied in with the workings of the BBC. Because we couldn't face having our galaxies different from those in the original Elite we took no chances; Warren wrote a small 6502 emulator to run that section of AU code.

Another idea which didn't make it to the final game - a pretty 3D Elite logo on the start-up screen.

Operating systems

thousand and one he wind of change is blowing through

the market and Acorn's Product Development chief, Peter Bondar, has made no secret of the fact that the company is examining Taos as a possible operating system of the future. But what is it? And why is Acorn interested?

The blurh says that Taos is a multitasking, multi-threaded, multi-processor, parallel processing system - it's all things to all users and probably makes tea as well - but that doesn't really help. Let's take these terms one at a time and see where they take us.

Jargon explained

Multi-tasking is the easy one; our machines have been doing this trick for seven years. It's simply the ability to run more than one program at a time, running the alarm clock and the CD player software together, for example.

Multi-threaded means using the same code to do more than one task at a time. With the standard Acorn operating system, multi-threading usually only applies to a single program; if a program can handle more than one document at a time, it's multi-threaded.

However, it can get more complex you might get a piece of code that is executing which passes control to another routine, at which point the same code can get called again from another place and get executed. At this point you would have one piece

of code with two 'threads' running through it.

Multi-threading is not very common with RISC OS, though it does happen in the background a reasonable amount. Some routines can do it, some can't, With Taos, every routine can.

Then there's multi-processor; we might he able to plug a 486 PC card into the Risc PC and run Windows, hut that doesn't make it multi-processor - at least not in this sense. What's intended here is to show that Taos will run on any processor. Taos programs don't require a huge effort to covert from platform to platform either any processor for which there is a Taos kernel and interpreter can run any Taos program, without modification.

But it's even more useful than that: if you have more than one processor - and the kernel knows about the other processors - Taos automatically distributes the executing code across the available processors and thus runs as a parallel processing system. And with parallel processing every additional processor adds power,

There does come a point where the sending and receiving of messages between processors can cancel out any increase in power that adding another processor brings. However, it takes quite a few processors to do that and, theoretically, Taos can handle over two million of them.

Taos for Acorn

Just one week before I was due to hand in this review I received my advance copy of the Taos development system for RISC OS. It's not entirely finished and won't be released for a while yet, but further changes are really a matter of bells and whistles rather than any fundamental alterations.

Taos comes in two varieties: TUI and GUI. The first is the textual user interface and the other is the graphical user interface; each is a separate application. There's the ARM6 kernel application which provides the Taos environment and needs, by delault, 6Mb of RAM to run in. though it can run in less if needed. The final part of the system is the 32Mb DOS

Operation (stems

Steve Turnbull opens the Pandora's box that is the Taos operating system.

partition. 32Mb is not an absolute requirement – the current size of the installed Taos code is just 8Mb – but it allows for future expansion. As Taos was originally developed on a PC it expects lilenames to be in the old 8+3 DOS format and it needs virtually unlimited files in a directory. The Acorn filing system can't handle 11 character filenames or more than 77 objects in directory (yet). Unfortunately, Taos must have an identical file system on every machine it runs on; hence the DOS partition.

One of the delays in releasing the system was the need to produce an installation routine that can create the partition without the need for the PC emulator or *PCconfig* application, which is what I was able to use. From there, installation is just a matter of using a version of *Spark* to unpack the *.zip* files off the floppies and into the partition. Once this has been done, Taos will run.

It's tool time

When any Taos program – or Taos itself – is run for the first time there is an enormous amount of disc activity and it can take quite a time to get up and running. One of the unique features of Taos is its use of tools: it's almost true to say that where most programs have subroutine calls, Taos has accesses to another tool.

Each tool is a very short (100-150 byte) piece of code that carries out a very precise and quick action, though it might require further calls to other tools to achieve it. It is located on disc and is accessed via its file name and path. The good news is that once it's loaded, Taos will hold it in memory until it's no longer needed *and* its space is needed by another tool. Bearing in mind that each tool is very short, you can get a lot of them into the space provided.

For, example let's say you've written a piece of code that needs to calculate the SIN of an angle. To do this your code would call the MATH/SIN tool or, if a floating point version were needed, MATH/SINF. Both tools are stored in the MATH directory in the partition. Now, the MATH directory contains all the tools to implement the C math library, but the nature of Taos means they are all separate and any program can call them, regardless of the language it's being written in. No special interface is required – try that on any other machine!

Another reason for having short lengths

Francis Charig, Chairman of Taos systems.

Chris Hinsley, Technical Director and founder of Taos.

Operating systems

of code is the way Taos operates as far as different processors are concerned. Until now I've rather glibly stated that code is translated as it's loaded. Let's take a closer look at that.

Taos programs are generally written in VP code - VP standing for Virtual Processor. VP code is an idealised set of instructions and directives that, while not elegant, is certainly compact. When a call is made to a tool that isn't loaded, Taos checks the path to the directory and examines what's there. Routines that end in .00 are VP code routines, so MATH/SIN.00 is the VP code for calculating the SIN of a number.

If this were the only one available, Taos would pull the code in and translate it into ARM code - or 486 code, or Pentium, or R6000, or whatever - and then execute it. Any further calls to the code would not require the translation step as long as it's in memory. If it got purged it would have to be reloaded and re-translated.

But the load check doesn't stop at VP code. It may be that a particular function can be re-coded especially efficiently for a specific processor, so it's possible to

write a machine-specific routine, give it the same name, but make the file extension a different number relating to that processor. The number for the ARM2/3 series is .05, and .08 for ARM6/7 series. This means that when Taos is looking for the code to execute, it checks for routines that are specific to the processor first and for VP code last.

What's in it for Acorn?

While Acorn may not currently be the biggest manufacturer of computers in the world, it's certainly one of the most innovative, and within the next two years Acorn is very likely to produce a 3D user-interface for its machines, and for responsive 3D work you need power.

Not only is Simtec developing the five-ARM system for existing Risc PCs, hut Acorn has also revealed that it's planning to produce a multi-processor machine which has exactly the kind of power to deliver an effective and responsive 3D system. What Acorn doesn't have is an operating system.

Up to now, all parallel processing computers have required finely-tuned operating systems that usually have some sort of hierarchical control methodology. Taos throws this out of the window there is no boss processor, each one operates on its own and uses an algorithm to compare its own 'power' with those of its neighbours. If one of its neighbours has more power it gives it the process to execute, then gets on with its own work.

Taos absorbs more power in messaging than the clever OSs, but it makes up for it with simplicity and robustness. This is precisely the philosophy that Acorn uses in the development of its hardware and software: make it clean and simple and it'll work fast.

The Taos GUI, in my opinion, is horrihle. It resembles Windows and lacks any subtlety. However, this is not important -Taos can huild any GUI you want, whether it be the 3D-Rooms of the future, or the RISC OS 3 of the present. What's more important is that once it works it can be put on any processor that runs Taos, and suddenly you'll have Acorn's Rooms or RISC OS on any machine you care to mention. AU

The future may well be Taos.

Prop

A brief history of Taos

Taos was not initially created as a multi-processor operating system. Its first incarnations (in 1989) were as a macro language to help port games between different platforms. But its Inventor Chris Hinsley decided to target the forthcoming 32-bit machines rather than aiming at the popular machines available then.

During the early part of the 1990s, development by a core team of enthusiasts continued until Francis Charig joined the group, setting up Taos Systems with Chris and Tim Moore (who had also been a major part of the development team) and organising financing from Japan.

Since then, development has continued apace, the team has grown, the company has managed to sustain itself without creating any debt whatsoever, and has now established a group of major consumer electronics companies as customers which assures it of long-term stability. Some of these companies will be using Taos as their primary operating system.

As a product, Taos is able to offer an unusual solution because its features allow manufacturers to utilise a single operating system that can be used with PDAs (personal digital assistants), mobile phones, faxes, printers, VCRs, set-top boxes, personal computers, games machines, virtual reality, video servers and so forth, regardless of the processor and using common software. Within the games market, there will be a developer's kit launched which allows games to be written once which will then run across dissimilar workstations and games consoles.

Taos Systems considers its competitors to be such things as OS-9, pSOS, Win95, UNIX and the IBM Microkernel, but these are mostly processor-specific and lack the generalisation of Taos.

Taos is portable, exactly the same code runs on any processor or machine for which a Taos translator exists with minimal speed degradation - given that there has to be some slowdown since code translation is involved. It's also highly compact -- the ARM kernel occupies just 7K while the Intel one occupies 10K.

Taos is also a parallel operating system in which it self-load balances using an optimising algorithm across the network, capable of distributing across up to 2,000,000 processors in a single network. So long as the bandwidth between processors is sufficient, the performance on the network will increase. This is the result of using a masterless network rather than traditional techniques.

8y being parallel and portable, Taos can run with dissimilar microprocessors across the same network, with everything being shared, even though the processors are dissimilar. Thus, an ARM-based workstation can take advantage of Intel 486s as they are added to the network and will distribute the process load according to the power available on each processor. This provides consumers with futureproofing as they are able to extend networks based on the latest technologies as they become available, not just on historical decisions. As interest in Taos increased there was pressure to permit outside development of actual software. However, this was resisted to allow the OS for Taos to be put together into a usable structure, which now exists.

A number of global consumer electronics companies involved with Taos will be announcing their support formally over the summer. There is also going to be more public support for Taos from the cable and satellite companies in the months ahead as they look for an effective solution for interactive television.

Pros: Update keeps Sibelius ahead • Already excellent manual improved Cons: Expensive for Sibelius 7

Sibelius, the score draw package for Acorn platforms, has achieved a high profile for a niche product. Widely acknowledged as the fastest and cleverest score notator, bar none, it generated welcome publicity for Acorn recently when both the Royal College of Music and the Royal Academy of Music chose the Acorn/Sibelius comhination over PC- and Macbased alternatives.

Constructed by knowledgeable musicians, the software handles the arcane and idiosyncratic rules of music publishing with a sensitivity that more mechanical competitors cannot manage. The current version (2.5) of *Sibelius* 7 provides a number of enhancements.

The first is enhanced replay. Not only can you record and replay via MIDI instruments. *Sibelius* also reads dynamic and text instructions and can introduce expression consisting of subtle tempo variations. This makes rubato-rich scores like a Chopin Etude sound as if they're played by Rubinstein rather than a Dalek, which must be a good thing, despite suggesting that even great interpretation is more programming than inspiration.

The handbook has been rewritten to give more guidance to those without computer experience, though the impressive list of real composers who use *Sibelius* is the best evidence that this is a working tool rather than a toy. An early problem with ambiguous display of enharmonic notes has been corrected. If you're in Eb you expect Ab to appear as Under scrutiny this month: Sibelius 7 update • Textease • MovieFS • CineWorks • ClearView 2 • Iota colour scanner

Ab, not as G#, even though on a keyboard they're the same note.

While some users will be content to use mouse and function keys for input, musicians are bound to prefer the faster and more intuitive piano type keyboard. Current versions of Sibelius accept such input in real pitch, but not in real time - the notes come in as a monotempo crotchet, irrespective of their real time values, and must be subsequently edited. The reason for this restriction has puzzled some users who are familiar with sequencer software like Clare's excellent Serenade which accepts real time input.

However, *Serenade* has the undemanding task of rendering the note length as a scaled horizontal line, whereas *Sibelius* must display it as a fixed note symbol – a crotchet, minim, or whatever. Even maintaining strict tempo, a keyboard player's note lengths will vary by a percent or two; indeed, perfectly metrical playing sounds mechanical and lifeless, and performers instinctively avoid it. Realtime stave notation thus consists of extremely complex sequences of unrealistic bar lengths, and time signatures which would be unplayable.

ript

The solution is to apply quantisation rules to interpret the input according to what the player intends. As with speech recognition, this is a quest for the holy grail (though the rules of musical language are more restricted and amenable to specification than the grammars and syntax of speech). Version 3 of *Sibelius* will make a stab at processing real time input, but how successfully and when are as yet unknown. It will also then be able to import and export MIDI files, which for the same reasons cannot currently be sensibly interpreted.

I took Sibelius Software's advice and used a Roland SC-88 sound sampler to replay scores through a hi-fi. The SC-88 stores digital samples of 600 high-quality instruments as well as a cornucopia of trains, planes and horses hooves. The stunningly realistic sounds eclipse the 16-bit multimedia audio we're just getting used to. Sibelius will sell just the software or set you up with a complete supported hardware package, and this update makes sure that this package is the best in its field.

Clem Vogler

A typical score in Sibelius 7.

Textease

Product: Textease Supplier: Softease Tel: (01332) 204911 Prices: £29,95 without spell checker

- £39.95 with spell checker Site licences for primary and secondary are available
- Pros: Ease of use Value for money
- Cons: Spelling checker is optional • Graphics can lose their aspect ratio

With one or two exceptions, all DTP programs are framebased. Simply, the user is provided with a frame into which may be placed text or graphics (usually not both). The user is able to alter the frame and/or add new frames into which more text or another graphic can be placed. Depending on which program you are using, adding new frames and moving them around can be simplicity itself, or it can be hell on earth.

Softease felt that a framebased document processor was not the way forward, so it has produced an object-based program called *Textease*. Objectbased software is not new. *Draw* is an object-based program, as is *ArtWorks*. In simple terms, each item placed on the screen is referred to as an object, and each object can be controlled independently of every other object.

So how is all this better than using frames? Well, I guess the answer will depend on what you are currently used to using. For me, the advantage

1.

Textease contains all the modern features usually found in desktop publishers and word processors – button bar, spelling checker and on-line help.

is that I don't have to 'set up' a document. I don't need to hegin laying out frames, getting them to lit and then flowing text from one frame to the next. I can just load in the program, click where I want to type, and type.

As a productivity tool, there are no equals to Textease. Graphics can simply he dropped in anywhere and positioned as required. Objects can be placed either on top or behind other objects, can be aligned vertically and/or horizontally with other objects, and can also be copied. All these are features which users of Draw will he very familiar with. You can also drag in text from other applications in the form of a text file, place text in multiple columns, and fully

justify and globally or selectively search and replace features with which users of word processors and DTP packages will be familiar.

Textease has some other features which I believe are unique. My favourite is the spelling checker which checks as you type and beeps when you enter a word it doesn't recognise. Yes, I know, they all do that. But Textease leaves the unrecognised word highlighted so that you can easily spot where it is. Your attention is also drawn to it before printing commences. Textease can save files both as conventional files in native format, or as text files. Textease can also save files as templates. When a template is loaded, the program forgets the pathname and when an attempt is made to save, the user is provided with a default filename ensuring the modified document is not saved over the template.

So who's going to buy it? The simple answer to this is anyone and everyone. *Textease* is aimed at education in general, and primary schools in particular. For younger users it is excellent, but to call it an 'educational program' is, I feel, a marketing mistake. In my experience, if a program is labelled as educational, nobody above the age of 15 seems to give it a second look except teachers. This program will easily do everything the average home user would want and much more besides. In fact, this program is far more advanced than one would guess. All being well, I'll be following up this article with a second aimed at the advanced user.

As it is aimed at education. what will it offer? Everything that students need to be able to do can he done with Textease. Therefore, as a word processor/DTP package it is certainly all that is required for the communication element of the first strand of the Information Technology capability (Communicating and Handling Information) KS1 - KS4, But 1 feel that this program really comes into its own when used in other subject areas. Because of the software's ability to allow the user to 'click-andgo', it will be especially useful for labelling maps and diagrams and creating spidergrams.

Students are forever pulling material down from teletext. *Textease* will allow the material to be neatly presented a good deal more easily than with conventional frame-hased processors. This is especially true when text and graphics are bought together on a single page, as is the case when students download material for CD-ROM.

Short reviews

ClearView 2

Supplier: DEC_dATA Tel/fax: (01392) 221702 Price: £40 inc VAT and P&P

Pros: Compact hypertext system • Import Draw, sprite and Euclid files • Comes with freely distributable viewer

Cons: Script language is a little hard to learn

ClearView 2 is hypertext/multi-media application that enables you to create and view files which are designed like reference books.

The manual is a ready-made ClearView 2 file and therefore a good showcase for what the program can do. I was impressed with how clearly everything was laid out. To view a file you use a series of icons, such as move to next page, go back to previous page, go to index page. There is also a 'back trace' icon which returns you to the last page you looked at so you don't get lost looking through a file, which makes it very easy to navigate a ClearView file. Certain words in the text have coloured boxes around them; these are 'reference points.' Clicking on them takes you to a topic related to that word. To make words stand out without making them into a reference point, there are 'text buttons' which make a word stand off the page - these are

only there for decoration.

Although *ClearView* is excellent for viewing files, it is harder to create the files in the first place. It took me a couple of hours to learn how to make a small file without generating errors. You are not able to create a file in the program itself; instead you have to do all your page-creation in a text editor such as *Edit* or *StrongED*, using a script language not unlike HTML

There is a 'skeleton' file that comes with *ClearView 2* which contains the basic layout from which you would make your

own *ClearView 2* file. This is a good tutorial for first-time users of the program because you are able to add your text in the places indicated in the file. The file comes with two fonts already available to use, although you can program in as many fonts as you want by giving each one a number. You are then able to refer to a font just by using an abhreviation of the one you require.

Other options presented to the user are: whether to give each page a topic title, to rule off below a piece of text, create a reference point or text button, or even import *Draw* files, sprites and Ace films. It will

The ClearView 2 manual is supplied as a Clearview 2 file.

also Filer_Run files, allowing (for instance) Replay or *Rhapsody* files to he run.

ClearView 2 is quite a useful piece of software, but would have been even more so had the programmer included a way to programme your files inside *ClearView 2* instead of having to use a text editor. It isn't very user-friendly when your script files go wrong, so be prepared to spend quite a few hours just getting to grips with it before actually attempting to create a proper file.

However, as a compact (320K) hypertext system, with a public domain file reader, it excels.

Richard Verity

MovieFS

- Supplier: Warm Silence
- Software
- Tel: (0585) 487642 E-mail: Robin.Watts@com-
- lah.ox.ac.uk Price: £26.42 (£19.80 to
- *Acorn User* readers see offer)
- Pros: Allows AVI, Quicktime and other 'foreign' movie formats to be played on Replay • Will convert to

Replay files • Very simple to use Cons: None, other than the need for such liles to play

in the first place

MovieFS is one of those very awkward products to review that 'does exactly what it says on the packet.' It acts as a 'front end' for Replay, and supplies extra codecs to play a number of foreign video file formats, after converting them

Special offer

Up to the end of September, Warm Silence Software is offering Acorn User readers the chance to buy MovieFS at a 2S per cent discount price of £19.80 all inclusive. Simply contact Warm Silence Software – quoting Acorn User and this page number – and you will be able to claim the discount.

to the ARMovie standard. Once you have installed MovieFS on your system, perhaps running it on boot up, you notice no difference, except that now you can play AVI, Quicktime, Animator Pro and WAV files - Replay is a perfectly good sound-only system as well as a video one - as if they were Replay files. This means that any system which uses Replay will be able to play the files back with no fuss whatsoever. The odd file may give it trouhle, but I have found very few that refuse to play.

Surprisingly enough, this works and is completely transparent to the user. There are a few frills – an application to correctly set the file type of files on a DOS-format CD-ROM

according to the file name extension, and a self-confessed kludge to allow Quicktime files on a Mac CD-ROM to be run. This is a program that you drop into your hoot sequence and forget about, so smoothly does it run.

More file formats (including MPEG) will be supported in the near future, but the current crop is enough to allow you to access videos and animations on most CD-ROMs and on the World Wide Web. To be honest, if you're not into either of these, you're not likely to encounter the sort of files for which you will need *MovieFS*, hut if you are I would call it an essential purchase. Replay files are rare on the Internet, but AVI is almost a standard.

David Matthewman

CineWorks

Supplier: Oregan Software Developments Tel: 0121-353 6044 E-mail: sales@oregan.demon.co.uk Price: £159.95 inc VAT

Pros: Very intuitive • Imports and exports many different video formats

Multitude of video effects possible

Allows for third-party modules

Excellent value

Cons: Still slightly unstable • More powerful than current Arc hardware

It's not often you come across a piece of software that shows up the lack of power in the Risc PC, but *CineWorks* is one such product. It is a multi-track video editing program, treating video clips rather as *Composition* treats bitmaps. The philosophy is: take all the clips you want to use, load them into *CineWorks*, arrange them in the order you want (with crossfades, video effects and even a good old-fashioned bit of CSO), and get *CineWorks* to create a finished movie.

The crucial point about all this is that *CineWorks* only keeps thumbnails of the movie you use in memory. These are good enough to show what you are doing, but make the program very fast to use and not nearly as memory-hungry as you'd expect

from something that is, after all, cutting and pasting IOMb files without a problem.

Say you have a clip of some seagulls, and also a clip of you walking on a beach and talking - Bill Oddie-style - about seagulls. You decide to use a portion of the seagull clip as an introduction, then fade to the walking on the beach clip, but have your commentary throughout. Simplicity itself in CineWorks - drop hoth clips into separate tracks, drop the heach clip into one of the audio tracks, drag the clips around until they are in the correct relative positions, drag out the bar on the bottom of the beach clip to set a transition, drag the crossfade icon from the 'transitions' window to the beach clip, and preview the clip. When you are happy with the effect, save the finished file to disc, and CineWorks will start to do the hard work of creating a video file at full resolution and quality based on the clips you have given it. It certainly beats all that messing around with pause buttons on two connected video recorders, and as it's all digital there's no quality loss in making conies.

Quality is the problem, of course. Anyone who saw the *CineWorks* demos on the *Acorn User* CD-ROM will have noticed that they were low-resolution and hardly comparable even to VHS quality. This isn't *CineWorks's* fault, however.

Here, an FLI file is combined with an AVI file, showing that *CineWorks* can easily mix video file formats. This also shows the path editor, allowing the picture to be moved around the screen for that *Top Of The Pops* feel.

The processing power and hard disc space necessary to cope with full-motion broadcast quality video simply does not exist in most people's Acorn computers, even Risc PCs.

Provided you can get the Replay files you want to use, *CineWorks* provides a highly intuitive platform for editing them, bristling with features. The review software I looked at was in a beta-test state – it did crash occasionally – and a much more in-depth look at this software is certainly required when it has been finally debugged.

David Matthewman

Microtek Scanner

Supplier: Iota Software Tel: (01223) 566789 Fax: (01223) 566788 E-mail: sales@iota.co.uk Price: £499 + VAT

Pros: Fast • Medium resolution • Good software Cons: Some problems with contrast

Back in the February issue of Acom User we did a round up of scanners, which ended with a note that there were a few more arriving on the market soon. On of these is lota's A4 flatbed scanner, based on a Microtek ScanMaker Hsp. This will scan 24-bit colour at a maximum optical resolution of 300 x 600 dpi - which can be interpolated hy software up to 1200 dpi. This puts it in the medium resolution range of flathed scanners - good, but less than pricey models such as the Epson GT9000.

The scanner is fast as it scans in one pass rather than building up the red. green and blue components separately. On the same 5 x 4 print as scanned for the last review, the scanner gave a preview scan in 12 seconds and a 300 dpi 24bit colour scan in 76 seconds. This is roughly comparable with the Canon 1X-4015, and faster than most.

The scanner is a SCSI device, so you will need a SCSI card to use it. Interestingly, lota has chosen to write its own software rather than use the popular Twain 1 ImageMaster combination from David Pilling. In general ease of use, lota's software is about the same as David Pilling's, although ImageMaster has many more image processing facilities. There is a proh-

lem with the software, which means that if you increase the contrast when scanning a picture the colours go haywire, but lota is aware of this and a fix is promised soon. It is a result of the hardware on the scanner having been changed recently, and should not affect carly buyers of the scanner.

This aside, the picture quality is excellent, detail in both light and dark areas is retained, and you would have to spend serious money on a high-end Epson scanner from Irlam to beat this one.

Wild progress

The Viewpoint in July's *Acorn* User makes interesting, but controversial reading.

From my 'viewpoint', responsible for managing Computer Concepts' hardware development and manufacturing arm, Wild Vision, I just cannot agree that we are abandoning the Acorn market. Not only are our current developments one hundred per cent Acorn related, but we have just had our most successful year in the market ever, something we could not have achieved by 'ignoring the needs of Acorn users.'

Our flagship product, the Eagle M2 multimedia card, has proved to be our fastest selling product of all time and we have struggled through the last few months with our factory at full capacity just trying to meet demand. Some of the companies you mention in your article would he rejoicing if they could achieve half the volume of sales we attain from the Eagle M2 with a low-cost product like a SCSI card, let alone with a technologypacked product retailing for over £300. Similar success stories can be told about our other newer products like Scanlight Video, TV Tuner, Lark A16 and MIDI card to name a few. Even the Chroma-Genlock, one of the first podules ever released for the Archimedes, is still as popular as ever.

Surely this is testimony to the many man years of development effort invested in these products and the marketing resources required to reach sufficient volume for us to offer them at affordable prices. While, as you are keen to point out, there are plenty of other companies ready to take our place, 1 do not believe any of them have been inclined to accept the high levels of risk involved in serious product development and product launches that we have.

This is a fact perhaps borne out by Computer Concepts' four pages of full colour advertising in your July edition, devoted entirely to proprietary products (as opposed to *Computer Shopper*-style supermarket price list ads). So what of the future? Over the last year we have been working in partnership with Online Media in the development of the MPEG technology used in its Set Top Boxes. Much of this work has been at the very leading edge of video technology and has already had one spin off into the Acorn market in the form of our Movie Magic card. I can assure you and our customers that there is more to come as well! We have an ongoing program of development of

MPEG and video technology. In the coming months this will be reflected in new releases of multimedia hardware that will fully exploit Acorn's latest platforms and offer a path of upward compatibility into the future. Moreover, guess who's developing the software – Computer Concepts!

Wild Vision may have had less direct visibility in the market place over the last year since Computer Concepts took over our marketing activities. As intended, we have been able to concentrate fully on product development and in doing so there has been no slacking whatsoever in our commitment to Acorn. When we first formed our alliance with Computer Concepts three years ago, it was with the declared aim of offering trendsetting multimedia products. Although some of Computer Concepts' software products may have reached a certain maturity in their development, the multimedia product range has some way to go before it could be called mature.

I believe we are already the number one provider of multimedia solutions in the Acorn marketplace and the claim to that pinnacle is not one we intend giving up without a fight. If we have competitors in the market place who are lulling themselves into a false

The Movie Magic card, one of the latest products from Wild Vision. And it's certainly not the last, according to Peter Wild.

sense of security by thinking our interest in the market is waning, they are in for a tough time

Peter Wild Wild Vision

Good news, I'm sure you'll agree. There's only one thing that bugs me: ScanLight Video was launched in 1993, the Lark card was released in 1993, the Eagle card is a year-and-a-half old, and the MIDt card, although reasonably new, is hardly the cutting-edge stuff we're used to from Computer Concepts and Wild Vision.

Peter says this is surely testimony to the development put in. Absolutely - I've always felt that Computer **Concepts and Wild Vision** research their products meticulously and release polished results. My point is that - to the outside world, at least - this seems to have slowed down immensely. The last major product was Movie Magic, which was released back in November 1994, and that's eight months ago. Eight months and still waiting for new products... (MM)

Very strong arm

In the StrongARM feature you stated three things: 1. An estimate SPECint92 for an ARM610 hased on a clock of 25MHz is 37.5.

2. The emerging StrongARM clock will be 200MHz.

3. The first StrongARM will be compatible with ARM6-7-8 since they have the same instruction set.

Surely the instruction set (mostly one instruction perclock cycle) is a major contributor to the high performance of the ARM chip, with regard to its apparent slower clock speed compared to the Intel world. Other factors such as pipelining and caches increase this base performance. This would imply that the StrongARM version of the ARM6-7-8 would have the same 1:1.5 ratio of clock to SPECint. Therefore an initial estimate of a 200MHz StrongARM would be 300 SPECint92! Hello Alpha, here we come.

On a slightly related topic, hands up all those Acorn fans, who think the silence from Acorn about new hardware is deafening. The product department must have something remarkable waiting in the wings. How about a Risc PC800 with ARM800 running at 50-75Mhz, 16-bit sound, 4Mb video RAM, MPEG2, optional Power PC/Pentium co-processor... and not forgetting the portable A75 with ARI (obviously) with c 486/Pentium PC

Whatever happened to the ARM710 upgrade for the Risc PC, or are they jumping straight to the ARM8 series? Malcolm Ripley

colm Ripley Glasgow

The ARM700 processor cards are due out soon, so don't hold your breath for ARM800 cards. The ARM710 cards can simply be swapped for the ARM610, and suddenly your processor is running at 40MHz rather than 30MHz. However, the PC card is apparently causing problems in conjunction with the ARM700 card – the one with the floating point chip – so that may appear a little later.

Still, Acorn has a new machine based around the ARM7500, which while priced below the Risc VC actually runs about as fast as the original Risc PC 600. It may not be a super-fast, superspec Risc PC, but it's fast and it's cheap.

In the meantime, the Risc PC has heen upgraded in specification – even the ARM600 model, which now runs at 32MHz. And of churse they all now have RISC OS 3.6. (MM)

support

I recently purchased the Acorn InterFalk software but am having problems using it. I have followed the instructions in/the manual and set up the configurations (correctly 1 hope) but when I try to run the program it gets as far as 'wait ocol', then it throws out an error message 'script aborted (incorrect)' and starts the dialling procedure again. And it keeps repeating that sequence ad-infinitum.

When I received the software, the package contained a printed card from a company called STNC Enterprises which contained a paragraph: 'The *InterTalk* Help-line is available for all users to answer any questions you may have about *InterTalk*. Calls will be charged in five minute periods on production of a credit card number. Alternatively for a fixed fee, unlimited telephone support will be provided. For more information call us on (01223) 572548.1

I telephoned the number and was told:

a. The credit card facility was not available;

b. The fixed fee was £200.

l was, however, offered one hour of telephone advice at a cost of $\pounds 20$, but only by payment in advance. I declined.

My own opinion is that I am appalled that there is no aftersale support from Acorn, and that the only support that is available is on a commercial basis at exorbitant prices. To put it bluntly, I think that it's a rip off and ought to be exposed.

I would be interested in hearing your comments, and if you can offer any help or advice concerning the problem mentioned in the opening paragraph. I would be very grateful.

Royal Moore Via the Internet

Could this be the start of support charging in the Acorn market? I don't think so, hut it is quite a hcfty charge for those used to free support. On the other hand, supporting Internet software is a full-time job, so it's understandable. (MM)

Networkz

You should warn your readers that *Fireworkz Pro* will not allow multiple access to data over a network. Only a single user *DataPower* engine is supplied with a *Fireworkz Pro* site licence.

This is a hit of sharp practice from Colton, like selling a Ferrari with cross-ply types fitted. A multi-user *DataPower* engine costs an extra £600!

Also, reviews are very complimentary, but surely reviewers have uncovered the multitude of bugs that have emerged in *Fireworkz Pro* that were not there in plain old *Fireworkz*?

Paul Williamson Castle Donington

Interesting point here – when does 'network version' mean 'works over a network', and when does it mean 'multiuser'? You live and learn. (MM)

Viewpoint

Whoever said 'Nostalgia is the English disease' was sadly mistaken. Diseases are unpleasant and certainly aren't beneficial, but as far as I'm concerned nostalgia is great.

And I'm not alone. From misguided ramblings about how life was much better in the old days, to retro fashion and repeats on the TV, we revel in the past. Take music, for example. The other day I bought ABBA Gold, the digitally remastered recordings from the kings and queens of Scandinavian pop. And do you know what? It's great. The last time I was into ABBA was when my dad used to play it in the car on the way to school, and judging by the number of people my age who know every word to 'Dancing Queen', it's not uncommon. Okay, it's a bit cheesy compared to the MTV-savvy bands we have today, but sometimes cheesy's cool.

Nightclubs playing 1980s music are packed out mid-week, full of people who are slightly embarrassed that they can recognise every song played all night – but, what the hell. At least we Children of Thatcher didn't invent tartan flares or lava lamps, we just inherited them.

And there's a strong similarity in the computer market. Nostalgia is a way of life for seasoned computer users, as anyone who has got involved in an 'I remember the days when RAM pack wobbles were real RAM pack wobbles' conversation at a computer show will testify. *PCW* has an excellent new column called 'Retro Computing' in which nostalgic journalists wax lyrical about the Mattel Aquarius and how it should have been the Super Nintendo of the mid-'80s. It's a great read.

But what use is nostalgia? As far as Acorn users are concerned, it's one area where they have an edge over the PC: have you ever met a PC user who wishes everyone still had an upper limit of 640K and used DOS? No. But people look back on the BBC with considerably more fondness, and with good reason. The BBC taught the Acorn market a thing or two that other markets haven't quite got to grips with yet.

Compact coding is one of them. Flagship Acorn products like Impression and DataPower don't take up that many discs, and if they do it's because the packages include obscene amounts of extra software bundled for free. I've just done a count on Impression Publisher Plus on my hard disc, and it's taking up about 1.5Mb – not a lot compared to the almost virus-like ability of Windows software to eat hard disc space for breakfast. Could this be an offshoot of the BBC's whopping 32K of memory, the machine on which a large number of RISC OS coders learnt their trade? Could be...

Another offshoot – possibly due to the lack of C and C++ compilers on the Acorn platform until comparatively recently – is speed. Because no cool coder would be seen dead programming in BASIC, despite its speed on the ARM systems, assembly language is the hip language for fast and furious coding. So we have compact and fast programs that whip Windows applications where it hurts most: performance. Remember the good old days when every good program started with '[OPT pass%'? Well, they're still here.

Stability is another attribute learnt from years on the BBC. If the Beeb was one thing, it was reliable (after the initial teething problems at the very beginning). You paid for quality and got it; this applied, also, to the incredibly cheap ZX Spectrum, but at the other end of the reliability scale. Beebs are still in common usage in many schools and homes today, a testament to the programmers and designers involved in the project. In the same way, Acorn hardware and software still has an enviable record for reliability, at least when compared to the Mac and PC environments. There are some lapses, but they're not *that* common.

Back on VE Day I heard a girl of 21 say 'I don't know why everyone's so bothered – what's the point in wallowing in the past?' The point is that the only way to move forward is to know where you've been, and people with her opinion end up being left behind. Luckily, Acorn is pretty good at learning from its and others' mistakes; it knows the value of nostalgia.

Good-looking OGOS

Tim Powys-Lybbe describes how to create eye-catching letterheads without taking up huge chunks of memory.

N ot unnaturally, many people doing a small amount of business want to put some emblem on the head of their letters. With most modern word processors, this is easy – you just construct a sprite or a drawing and put it in a frame at the top of the page.

But it's not so easy in practice. The worst problem for me was the additional 50K required for the sprite for each letter on the discs. With my correspondence of 40-odd letters a month this could add 2Mb every month; even with hard discs at the price they are, and with data compression utilities such as *ArcFS*, this soon produces an expensive demand for more discs.

The font solution

Some years ago I had read of a suggestion that the answer was to define a font with the logo as one of the characters. The idea of that was that the overhead for each document was only the few characters to bring that font into the document, and the main data for the logo was stored once in the font definition.

This was something I immediately thought a Good Idea and over the years accumulated some of the tools to follow up

PARTA-TUERT

The original logo, as a very memory-hungry sprite.

this suggestion. In my case I had a sprite that occupied a mere 1.4Mb in all its glory, though the part for the logo only took up 400K.

I use *Impression* so it gets a regular mention through this account. However, this technique will work with any word processor that can load in a *Draw* object, which includes virtually all word processors nowadays.

I approached one company that shall be nameless to enquire if they could define a font for this purpose. 'Yes, no trouble' was the answer. Then I sent them the sprite. 'No way, far too complicated' came back the reply.

This led to my obtaining a copy of *FontEd* to enable me to define the character for my logo. Slowly I found out how to use this complex tool, though fairly soon came up against the same problem: *FontEd* cannot hold much detail and crashes if one tries to make too complex a character. I persevered and eventually managed to produce something that looked like the logo I wanted, but with rather crude outlines and lacking some of the important details. This result did not appeal so I had to use the 50K sprite sparingly when I really wanted to use it.

One feature of RISC OS fonts is that they are in two colours and these are solid black and white in the original. Inevitably this means that surface detail is lost by using this font technique; however a logo is usually a simple, bold design and should not be textured.

Enter Trace

A related issue was that I wished to transfer the source original of the 50K sprite, a mere 1.4Mb of uncompressed sprite in 256 colours of mode 21, to an Irish Business Machines environment. I eventually found the answer in David Pilling's *ImageMaster*, which would convert a sprite to a BMP object. The more important thing was that with *Image-Master* came an update to an old program I had had for years. *Trace*. and I was reminded of another of his programs, *DrawToFont*, again included within *ImageMaster*.

Trace is brilliant, as is *DrawToFont*. *Trace* converts a sprite to *Draw* format with reasonable veracity. But converting the whole of a 50K sprite to *Draw* was a nonsense and I ended up with an overlarge object. The answer, that had already occurred to me at an earlier date. was to construct a font of many characters, each representing a different part of the logo and then assemble them as one large object in *Impression* by putting each character in a separate frame. The procedure is as follows:

1. Use *ImageMaster* to abstract each component piece of the logo. This was done in two stages using the Crop function, first a rough cut from the source sprite and second, from this, a refined cut of the desired piece.

2. Use *Paint*'s colour change facilities to get rid of any surrounding detail from the refined cut, to give a flat white background. This should not he to a transparent background because of a 'funny' in *Trace*, even though a transparent background is the ohvious choice; see step 4.

3. Use *Paint* to make each component all into black. This is partly because the font will be in hlack anyhow and partly as it makes *Trace*'s job much easier and produces a far less complex result in *Draw*.

4. Use *Trace* to convert each component sprite to a *Draw* object. As long as the *Paint* source was only in two colours, I found *Trace*'s default error factor of 0.8 to give very good results.

A curious feature of *Trace* will be seen if the source sprite has its background set to a transparent mask: anything that was thought to have been deleted by the mask will now appear in the *Draw* object. This points out that the transparent mask does not delete the data in those pixels, it merely masks them over and *Trace* finds what was there before. This is why a mask should not be used in the source sprite for *Trace*. The same effect can be found in *ImageMaster* for a transparent mask. A mask in *Paint* usually doubles the size of the sprite file on disc, confirming this interpretation.

5. Open the new *Draw* object. Use Select All to locate the background element that is created by *Trace* and delete it. If you delete the wrong element, close the file without saving and start again.

6. Simplify each *Draw* object in *Draw*. *Trace* will tend to add a few surplus segments that can be removed with judicious tweaking of the segment handles of those that remain. I might add that it has taken me a few years to become fairly proficient with *Draw*'s line editing facilities so this is not to be attempted by the novice, at least not unless you have made secure backups.

7. Enlarge each *Draw* object. whatever its real size, to roughly three-quarters of

A5. This is vital to the use of *DrawToFont*. 8. Put the separate objects into *DrawToFont* and save the resulting font. *DrawToFont* is, thank goodness, ridiculously simple to use and almost unfailingly successful, though see below.

9. Copy the new font into your fonts folder and re-boot the machine. The re-booting gets the new font loaded correctly for use.

One small problem

This method worked. A by-product was that I could quickly create the logo in *Draw* by suitably assembling and combining all the objects, and I had an acceptable result that occupied a mere 25K, saving 50 per cent of the space occupied by the sprite.

I then had to lahour to assemble the logo in *Impression*, using the various characters, one each to a frame, and enlarging and positioning until the required whole was produced. The composite frame in an *Impression* document was now down to 17K, including the 6K for *Impression* itself. Progress, but still a high overhead: now only 440K extra required per month.

A new problem now showed up. The composite logo had 22 separate frames for all its separate components, each holding one character, and for reasons best known to *Impression*, all these characters have to be redrawn, each in their own frame, every time one character is typed anywhere else into the document. The redrawing is slowed down by this, and the screen flashes as a result of each key-press – even with my ARM3 chip – badly enough to cause a brain seizure. This was not acceptable.

More thought and a night's rest produced the answer: try putting the whole logo as one character and see if *Draw-ToFont* will handle this. This was no trouble, and the one-character font was created quite successfully. But the Font Manager did not like this heavy character and would not draw it on the screen at all, an error condition that *Impression* handled gracefully, though something left the font file open as a result.

Eventually 1 split the *Draw* object into three separate objects, each taking up no more than 10K, as 10K seems to represent the upper limit of acceptable complexity for a character of a font. These were then made into a three character font and tried out in *Impression* to see if they would assemble properly. A little bit of trial and error and eventually 1 had a result. The logo was displayed for the addition of a mere 1.5K per *Impression* document, giving a monthly overhead of 60K, possibly reduced by *ArcFS* to a mere 10 or 20K: entirely acceptable.

The final cut

The crowning achievement only came when I was preparing some illustrations for this account. I made up the logo in

Draw and found it only occupied 350 bytes as a *Draw* file. So I deleted the assembly of characters from *Impression* and replaced it by this *Draw* file, giving an overhead of less than 450 bytes (depending on how one built up the document) that requires only 18K of disc space per month and much less with *ArcFS*. This confirms what I found with the 23-character logo, that *Impression* has a high overhead per additional frame, hoth in storage space and in redrawing time; *Draw* avoids this, for reasons that are beyond me.

A massive advantage of combining the font characters in *Draw* over *Impression* is that the result can be scaled larger and smaller totally satisfactorily in *Impression* as well as in *Draw*. In *Impression* scaling a combination of frames gets the component frames badly out of alignment and results in a mess.

Out of interest I tried this three-

character font in *FontEd* and discovered it blew up immediately, complaining that some buffer could not handle things. The Font Manager, then, can handle far more complex objects than *FontEd* and the only way to get them into the Font Manager is by using *DrawToFont*. Note that all this needs version 3.28 of the Font Manager; version 3.07, which comes in RISC OS 3.1, will not handle the large characters of the 'logo' font; indications are that its limit is characters whose *Draw* files are between 5K and under 10K.

I am now a happy camper! My thanks must go to David Pilling for producing such simple programs that do what no-one else has done for such a reasonable price. Thanks also to the anonymous person who mailed me a copy of *FontEd*, without which I would never have got to the desired end, albeit that *FontEd* was a red herring.

icrosoft, National Westminster Bank and The Guardian are some of the big names at Acorn World '95 whose exhibits will underline the theme of this year's show the Information Superhighway. Microsoft will be demonstrating its range of educational software - now highly compatible with the Acorn platform and running on the Acorn Risc PC 486 card - within the context of the Superhighway environment.

The Guardian's theatre session will complement its exhibit promoting Education Guardian, Online - the paper's computing, science, technology and communication section and The Guardian's affiliation with Wired.

The National Westminster Bank's exhibit will be pointing the way towards banking of the future and showing its involvement in the set-top box technology being developed by Online Media.

Acorn's main exhibit

The main exhibit will be circular and on two levels, will feature:

 An impressive educational area, with a row of the new Acorn A7000 models demonstrating the latest IT solutions.

• The information and sales desk, the place to track down those special, never-to-berepeated show offers.

· Technology City, the area that's a must for all enthusiasts, showing the latest developments on the Risc PC front.

· A knowledgeable Advice Centre providing 'straight from Acorn' answers to all your questions.

· A dedicated Clan Acorn 'rocket ship' system for members to try some 'hands-on' manoeuvres.

· A video wall which will recreate the Cambridge Trial, one of the first pilot schemes in the country, bringing homebanking, shopping, videoon-demand and games into

your living room. Participants include Tesco, Anglia TV, National Westminster Bank. BMP DDB Media, Needham, NOP and the Post Office. This will also give a taste of Acorn's newly developing education service, designed to be delivered to schools, homes and colleges using the emerging infrastructure technologies - in particular, broadband networks. The service will add educational value to existing content (video, audio, software, etc) and develop completely new ideas for interactive applications. Content providers signed up so far include the Open University and Anglia TV, with more large names set to follow suit.

. On the upper level, there's the 'multimedia experience'; the place to sit for a convergence of sound, visual imagery and information.

Other attractions

On separate stands in the hall there will be:

· A pre-school learning area: reflecting Acorn's recent linkup with the Pre-School Learning Alliance to develop and promote IT through the PLA's 22,000 pre-school playgroups in the UK - Acorn being the only computer manufacturer endorsed by the PLA. Experts in young learning from both organisations will be on hand to talk to parents and toddlers and provide some hands-on experience of IT packages designed specifically for this young audience. Mixed with face painting, games, jugglers, magicians and a colourful, toy-packed crèche, it promises some real fun with computers.

After the successes of Dune II, Eclipse has informed me that it intenils to produce a CD-ROM version of the popular game - the foll graphical introduction will be incloded, along with more speech and all the music. It's also planning to add several saved game files which would alluw players to access parts of the game that they might not bave seen. However, there will be plenty of space left on the disc, so Eclipse are thinking about including a short film on the making of Dune H, and a ilemonstration version of their forthcoming strategy game, Global Effect. The price of this product is likely to he around £49, and the upgrade for existing Dune II owners should be about £25. You can give Eclipse a ring on (01243) 531194.

Sim City Secrets

If yoor conurbations are crombling, or you've gut a hail case of the sprawling suborbs, help is at hand in the form of a hook by Andrew Banner, Secrets of Sim City 2000 aims to lead players through all the features of the game, suggesting a few new ideas on the way. It's written in an informal style, and is libersprinkled ally with screenshots. Seasoned

gamers will probably have discovered the majority of information in the book already; however, if you've just started piaying the game and you could do with some advice then Andrew Banner's guide Is simple to read. Secrets of Sim City 2000 costs £9.95 and is published by Bruce Smith Bouks – you can give them a call on (01923) 894355.

Andrew's hook is by no means the only collection of Sim City 2000 information around, and 1'd suggest that those with Internet access look for a copy of the frequently asked goestions list for the game, It's a veritable mine of information covering all aspects of the game. If you've ever pozzled over an aspect of Sim City, the chances are that the answer's huried in there somewhere. Neither of these items are specifically for the Acorn, so be prepared to wade through information relating to other platforms.

Mixed spice

i've been spending a lot of time playing *Dane H* recently, and any feliow players will recognise the feelings of frustration that arise whenever yoo've jnst completed your supposedly indestructible fortification, only to have it hlown to smithereens by a well-aimed Death Hand missile. Michael

Understand Sim City 2000 with Andrew Banner's book or by reading the FAQ on the Internet.

Richards has sent in a whole host of hints and tips for *Dune II*, so if yon're desperate to turn the tables on the Sardaukar, read on.

Firstly, make sure you've prepared a task force of vehicles oot of the way of the rest of the battle so you can launch a mass attack against yoor opponent. Yon'll have to knock out the missile turrets hefore you can safely attack the huildings, so include a few long-range vehicles such as the missile launcher or the Atreides sonic tank. It's vital to knock out your enemy's construction yard as early as possible, so it's worthwhile sending out a fast, expendable vehicle. on a reconnaissance mission to locate it. Bear in mind that you're equally vulnerable, so on later levels think about sending a mobile construction vehicle to a remote part of the battlefield in order to kcep your supplies going.

When the situation warms up, you may well find that the computer refnses to let yoo build any further structures or vehicles – this is particularly infuriating when you're desperate to build a silo to avoid losing spice. The only way round this is to mount an attack on your enemy and destroy a few things. This shoold jower the structure count enough to alleviate the problem.

Finally, a few general hints – spice is limited on some of the levels, so make sure you're out there collecting it as soon as you can. Be prepared to build three or fonr refineries if necessary, along with enough sllos to store the product. Destroy enemy harvesters on slght, and don't waste your cash once you've earned it; consider building a repair station to avoid the costs of cunstructing 'brand new' vehicles all the time.

Making the connection

For those of yoo that have access to the Internet, you might like to add Gareth Moore's 32-bit Acorn Gaming page to your hotlist - a World Wide Web document featuring news on forthcoming games, full reviews of a sizeable number of titles, and the obligatory hints and tips section. For those with a technical inclination, there is a whole host of links to programming resources which contain information and tutorials on the art of writing games.

I've been a regular reader for quite sume time now, and it's obvious that Gareth's put a lot of effort in to produce a high-quaiity resource. If yon'd like to take a look, fire up your World Wide Web browser and enter http://www.csv.warwick.ac.uk/ ~csuod/ as the URL.

PC Compatibility

Thanks to everyone who's written in with details of game compatibility on the PC card for the Risc PC – keep it coming. I've heen making notes, and I'll keep you posted with the details – the major pruhlems appear to be connected with

Digital Psychosis's Oddball gets the cheat treament.

Steve Mumford gives advice worthy of a Mentat for Dune II addicts.

graphics and memory. Programs requiring VESA drivers fail to work, and most of the newer programs need a reasonable slice of memory to run, However, 1 report moderate can successes with games such as Doom, Theme Park, Lemmings 3D and Magic Carpet. On the nther hand, 1'd avoid Cannon Fodder 2 and Lemmings 3; both crash the machine. If you're thinking about buying a PC game to use with the card, it's a good idea to hunt around for a demonstration disc first - if the game doesn't wnrk, you'll have saved yourself quite a bit of cash.

Assuming you've found a game that works, yuu'll probably be disappointed by the colour scheme; in the process of displaying the PC

screen, the Acorn chips in and converts all the PC enlours to their nearest equivalent in the old 256colour palette. Needless to say, this doesn't look too pretty, and is a hit of a shame considering that the Rise PC doesn'l really need to second-guess colours in this way. However, it's early days for the PC card, sn hopefully we'll see some driver upgrades in the future. I've already seen an unofficial patch that removes this problem, but it does tend to make a mess of the colours in the desktop. If there's anyhody out there who has written a patch and is willing to submit it, might I humbly suggest that you contact Acorn User? You'd make a lot of games players very

happy.

Cheat Corner

Here's a piece of information for *Oddball*, the latest game from Digital Psychosis. If you'd like to start the game on a different level, try typing the command:

*SetEval OddballCheat

followed by the level number to jump to that screen. If that's not enough, try selecting the instructions page and typing:

Stuff This

which will enable you to cycle through all the special tokens on offer by clicking the right-hand mouse button during play.

And finally...

A while ago, I received a letler from M. Chatterley, who would like to see some more coverage of lext-hased adventure games in the Game Show. I have to admit that they're not my string snit, but I have been known to spend hours in a state of complete bewilderment while playing games such as Jinxter or Wonderland, With this in mind, I'm tempted to dedicate a future column 10 the subject, but 1'll need some help from the adventure game fans out there. If you've got any questions, or perhaps more importantly. any solutions, please get in Jouch.

Before I move on, if yon fancy writing your own adventure game, take a look at the *Acorn User* CD-ROM – il contains *Zip*, an Infocom interpreter, as well as Graham Nelsmi's adventure compiler *Inform*. These programs also appeared on the *Acorn User* cover discs between the August and October issues of 1994.

If there are any subjects you'd like to see covered in the Game Show, or you've got some information that you want to share, please drop me a line. I'm always interested to hear from programmers, whether new or established, so if you're slaving away on a project and you think more people should know about it, you know who to contact.

Next month I'll be talking to Berty, otherwise known as Tom Cooper ~ responsible for games such as *Hamsters*, *Warelength* and *Lxion*, His lates1 game, *Darkwood*, is almost ready to be released on the unsuspecting world, and I'll be there to give you the details. See you then.

Steve Mumford

Doom will run on the Risc PC 486 co-processor.

The CD-ROM version of *Sim*on the *Sorcerer* allows you to listen to the wizards chattering away as they play Mah Jong – in their awful accents, of course,

Simon the Sorcerer

Supplier: Gamesware Tel: (01703) 456523 Price: £45,99 Upgrade from 3.5in disc version, £8,50 Demo CD-ROM, £9,99

Simou the Sorcerer has not had an auspicious history on the Archimedes. The original game turned np a full year later than intended, and we hod to wait another six months for the CD-ROM version with full digitised speech.

The CD-ROM version of Simon on other platforms is wonderful. I have encountered it on the CD-32 and It really lifts the gome to have all the characters speaking their lines rather than reading some text on the screen. As anyone who is up on the games seene already knows, Simon himself is voiced by Chris Barrie - recently of Red Dwarf and The Brittas Empire fame, though connoisseurs will remember hlm as the voice of Margaret Thatcher in Spitting Image who brings just the right sarcastic thne to the precocious 12-year-old.

Something went budly wrong in the conversion to the Archimedes, though. Not only have the music and sound effects vanished, hut the speech itself is distorted und muffled. At first 1 thought my internal speaker was on the blink but no, it's <u>worse</u> through hendphones.

Apparently, this is an mnavoidable consequence of He way the samples are stored on disc. It's certainly a great pity, because - far from enhancing the game the CO-ROM version of Staton is in many ways inferior to the 3.5in version. What is gained by adding speech is lost by making the speech unclear in places, and the village becomes a ghost town as Simon wanders past n silent forge with no music In the background.

The program also isn'I very intelligent about where it breaks long samples. Several limes in the introduction to both the game and the demo version. Simon pauses mid-word us the next part of the sample is loaded In. There is no attempt to put these breaks between sentences where they wouldn't be noticed perhaps this also was Imposslble because of the way they were stored on dise - so you have to cope with vital information being spoken in a distorted manner and stopning mid-word every so often.

1 hate being negative about any innovation in the Acorn market – a game op CD-ROM is certainly innovative – and Simon the Sorcerer is one of the all-time great games. Sadly, Simon the Sorcerer does not live up to expectations, and actually makes the Archimedes look shuddy in enuparison to other platforms. This is not fair on the Are; it may only have an 8-hit sound system, but it can do much hetter than Simon suggests. Don't show this one to your friends with PCs and Amigas – they'll laugh.

David Matthewman

Detritus competition

Reviewed in the July issue, Detritus from Myndgaemz is a complicated adventure with a plethora of puzzles to be solved. The game may take even experienced adventurers months to complete.

To celebrate the release of Detritus, the programming team Myndgaemz has decided to offer a prize of £100 to the first Acorn User reader to complete Detritus. The rules of the competition are as follows:

- A full solution, with a step-by-step guide to completion, must be sent to Myndgaemz, so it can verify that the whole adventure has been completed.
- The first correct solution received by Myndgaemz will win the prize of £100. It is therefore the responsibility of the player to keep the solution secret until the winner is announced. Myndgaemz accepts no responsibility for policing 'stolen' solutions.
- If no solution is sent in by the end of September, the competition will be declared void and the prize will not be awarded.
- The competition is open to registered users of the game only this does not include copies provided for review.
- The competition is not open to friends, family or employees of
- Myndgaemz, Byte Back Computing, or Acorn User.
- The decision of Myndgaemz is final and no correspondence will be entered into.

Completed solutions should be sent to:

Detritus competition Myndgaemz 18 Mallory Crescent Fareham Hants PO16 7QA

and may also be submitted by e-mail to: mgaemz@jonwat.demon.co.uk.

Detritus is available for £29.95 from Byte Back Computing, PO Box 40, Nottingham NG5 655, tel: 0115-955 4501,

've always liked the idea of using the computer to make something which isn't on a flat piece of A4 paper, so I was particularly keen to try some of the *Colour 'n' Wear* kits distributed by Quill Marketing.

There are several kits available, from the basic four A4 sheets up to kits which include a T-shirt. You can even buy a mouse mat kit. The theory is simple – use the computer to draw a picture, print it onto the special film using an inkjet printer, iron it onto a garment and wear it. The trouble with most clever things like this is that it works fine in theory, but falls over as soon as you try to put it into practice. This doesn't. It really does do what it says it does.

Step one – design

Designs can be created in several ways. Drawing them yourself is the obvious option, hut some very pleasing results can be obtained using PD clip art. If you're fortunate enough to own a video recorder and have a digitiscr, you can include a photo into the design. Extra care should be taken here though, as many printers don't make a very good job of photos unless they're back and white.

Some clever text effects can be added with the use of such cheap utilities as *Fontasy* and *DrawBend*, both by Ian Copestake Software. *Fontasy* enables text to be printed around a curve or irregular path, and *DrawBend* can 'mould' text into an irregular boundary. *Acorn User*'s *Stretch*, which appeared on the cover CD-ROM, can also produce some clever effects.

The design need not occupy a whole sheet of iron-on film. Small logos can be printed and then cut out hefore ironing on to a garment. But rather than running the film through the printer several times, it's better to create a page full of designs, print the whole page in one go, and then cut them out before the iron-on stage.

Step two – printing

In most cases, the computer artwork will need to be flipped left to right so that a mirror image is achieved. This is particularly important if the design contains lettering or digitised photographs. Most programs have a flip facility built in, although it's not always obvious. In Draw, for example, you should group all the objects together (Ctrl-A, Ctrl-G) and then set the X scale to -1 (in the Transform sub-menu). If you're using *Publisher*, go to Typesetting... in the Print dialogue box, and choose Reflect pages to output a mirror image.

It's not necessary to have a top-of-therange printer for this job. It's not even necessary to have a colour printer. In fact, if you've got an old dot matrix

Custom clothing

printer and a pack of marker pens, you can still get some excellent results.

Step three ~ ironing

Having printed the design onto film, the film is now ironed onto labric. Initially, it's probably best to choose white fabrics as these will not alter the colours, unlike dark colours which may not provide the necessary contrast.

Place the garment flat onto an ironing board, put the printed lilm onto the garment and place another piece of fabric on top - a pillow case is probably best. With a very hot iron and firm pressure, move the iron broadside along the long edge of the transfer. The instructions supplied are very precise: follow them carefully. Gently smooth the fabric with your hand and leave to cool for a few minutes.

Step four - washing

After wearing the garment it will need to be washed. This is the stage most other similar products fail. To wash the garment, turn it inside out and wash in cool/warm water. Dry at the 'cool' setting and do not iron the surface with the transfer. Geoff Preston tries out Quill Marketing's range of iron-on transfers.

Special offer

These 'Colour 'n' Wear' products are great fun. We at Acorn User have arranged a special offer in conjunction with Quill Marketing. Details are on the form below. Quill Marketing stocks a range of 'Colour 'n' Wear' kits. For a full list, contact Quill Marketing on: (01603) 748002 or fax (01603) 748003.

Data-handling is not new. Even before computers, people have needed to have access to information, and traditionally schools have taught pupils how to gather information in hooks, card index files and other paper-based systems. With the advent of the computer, however, we are now able to use a machine that could sort, search and present that information much faster than traditional methods, processing large quantities of information with great ease, especially with the advent of CD-ROM. The need to manipulate data has become so essential in today's world that the National Curriculum has defined a hasic set of information-handling skills which all pupils must have the opportunity to acquire. Many people, however, have been put off the idea of using a database because the traditional computer databases did not make these skills easy to learn. They put many pupils off with their unwieldy terms such as 'fields' and 'alphanumeric."

Junior Pinpoint's capabilities

Junior Pinpoint provides an easy-to-use desktop environment in which pupils can create their own questionnaires which become the database when completed so that the need to construct a database is eliminated. Once created, the questionnaire can be completed in one of two ways: it can either be printed and photocopied to be filled in manually, or can be completed directly with mouse and keyhoard. The option to use multiple choice questions can help to all but eliminate spelling errors, if necessary.

The program is divided into four main sections. The *form designer* is like a desktop publishing environment where pupils can design their own questionnaires. There is the opportunity to design questions, write text, draw lines and boxes and import *Draw* files and sprites to make the questionnaire more attractive. Once completed it can be stored on disc for future reference but is easily accessible if the pupil wishes to modify it in some way. The *sheets* option allows you to use the questionnaire to answer the questions

A survey sheet, arranged as a questionnaire, allows a simple database to be set up.

Presenting the evidence

Colin Rouse surveys the flexibility of Junior Pinpoint, a new concept in data-handling software.

contained within it, answering a yes/no question by clicking a mouse-button or typing in a longer answer using the keyboard. The *spreadsheet view* is where you can sort the information gathered, select some of the sheets and print lists or draw graphs. Finally, there is the *desktop publisher* where your graph is drawn on to a sheet of paper as in a DTP program. Here you can add text, lines and boxes to produce a finished report to a very high standard.

In the classroom

Contained within the software is a well thought out manual which is unusual because it is written for children. Working their way through it enables children to experience the many basic skills necessary for information handling in a series of real tasks such as: understanding the need to collect information, using record sheets, entering information, drawing graphs and producing finished reports. Presented as a set of photocopiable sheets, the manual will lead pupils from an understanding of the nature of information handling right through to developing the skills of collecting information, creating their own databases and producing high-quality presentations and reports.

By working through the manual, the pupils will have the opportunity to gain the essential skills of data-handling while undertaking real and well thought out tasks. They will have the opportunity to use the skills necessary to achieve the data-handling statements of attainment,

Junior Pinpoint will produce results in the form of graphs.

Product details

Product: Junior Pinpoint Supplier: Longman Logotron Tel: (01223) 425558 Fax: (01223) 425349

Pros: Good user interface • Excellent manual, written for children • Simple database creation for primary schools

Cons: None

starting at level one and progressing to level five and beyond in a coherent and interesting way. Pupils also have the opportunity to communicate information using *Junior Pinpoint*, which again takes pupils up to level five and beyond. All the examples are set in a curriculum context and include ideas for follow-up work or for solving problems using existing data.

Conclusion

Having used *Junior Pinpoint* extensively in the classroom, I have found it to be a program children soon find easy to use. The manual takes them through a series of tasks which they find interesting and this work provides a good stimulus for children at the higher levels to undertake a survey of their own choice, allowing them the opportunity to interrogate their results and present their findings in a professional manner. This package would have a place in any primary classroom.

Apart from the data files already held on the disc, Longman has produced a series of *Junior Pinpoint* support packs for various curriculum areas. Titles include: *The Olympics, Dinosaurs* and *The Victorians*. A sample *Junior Pinpoint* questionnaire constructed by me, called 'All about Me', can be found on this mouth's cover disc,

Family trees

aving retired from the company 1 had worked for for 43 years, 1 wanted to find something to do that would supplement the inevitable decorating, gardening and the many other jobs around the house I would have to catch up on.

Coming from a very large family, 1 thought it would be a nice idea to trace our family history and record the information in such a way that it would be of lasting interest and value to myself, and to my many cousins. But how could 1 do this in a relatively simple and convenient way, but produce a high-quality document?

Enter the computer

I decided to put my Archimedes 410/1 and some of my software to use for this major project. As this was to he more than just a family tree, I decided to create a loose leaf booklet using *Ovation*. A separate page would be used to display

Family Jim Farrow compiles a record

Jim Farrow compiles a record of his family, for his family.

information about each family member with additional information about their marriages and children. A picture of each member of the family would be included with such details as where they were born, where they worked and comments about their hobbies and interests.

I used Ovation because of its ease of use, particularly the simple means of being able to draw lines within the program and then to be able to add 'end caps' to the lines. This is particularly useful for placing arrows to identify people in the many and various 'group' photographs I used. To achieve this, I created a text frame with a border to take the individual's name, with a line leading from this to the relevant person in the picture. Line thickness, length, colour, end cap and position are easily adjusted. To do the same in Computer Concepts' Impression is a little trickier as you must create the line of the correct thickness and colour (and with the arrow head) in Draw, and then import it into Impression as a graphic.

I scanned the photographs with Computer Concepts' Scanlight Plus scanner, and needed to carry out a small amount of enhancement before cropping the pictures to fit the frames. I then saved them as *Draw* files and imported them into the *Ovation* document.

A Draw file imported into a Datafile Gothic Frame and modified in ArtWorks,

A picture showing the use of frames with borders and lines with 'end caps'.

ties

I wanted to use different fonts for differ-

ent sections of the booklet and needed to

control the use of these in a straightfor-

ward manner. Consistency of style is also

very important. Fabis Computing's Easy

Font provided me with on-screen styles of

the all the fonts I had, and used a simple

process of installing and de-installing

Ancestry from Minerva was invaluable,

and although this was not RISC OS com-

pliant and would not allow me to print out

the family tree on my Canon printer, it did

allow me, in a very precise way, to record

and retrieve all the specific dates and

information for each individual of the

family. This program has now been

upgraded to Ancestry II and because this

version is fully RISC OS compliant, I am

now able to create a family tree in the

style and design I choose, and import it

To add a touch of style to the pages, 1

into Ovation as a graphic.

them which made selection very simple.

Using fonts

used *Gothic Frames* from The Datafile which enabled me to place some intricate designs around the graphics and text frames. More recently I discovered that papersoft supplies templates for the Acorn range of computers that are compatible with paper frames produced by Paper Direct. 1 am now experimenting with these to determine which of the designs I will use to further enhance the final appearance of the booklet.

I wanted the final pages to be produced in a high-quality print. A laser printer would have been preferable, but I found that some very good results could be achieved with a Canon BJC-600 printer,

When the record is finally completed, each member of my family will be presented with their own copy of our family history.

RapIDE Fast IDE Interface

32-bit DMA-based IDE Interface for the RISC PC. Interface provides vastly increased throughput over the RISC PC motherboard. Using alternative drives it is possible to achieve reading speeds approaching 8Mb per second using 32-bit direct memory access. Provides two IDE ports, allowing upto 4 devices to be connected including IDE CD ROMS.

Supports the new enhanced-IDE (ATA-2) standard, which will allow all PIO modes (up to mode 4) to be used if the hard drive will support it. Full fitting instructions supplied. Also available, a range of fast IDE hard disc drives.

| RapIDE RISC PC Interface | £ 99 |
|---|-------|
| 540Mb 12mS IDE Drive | £ 155 |
| 850Mb 12mS IDE Drive | £ 205 |
| 1.08Gb 10mS IDE Drive sustained data rate of approx. 7Mb/sec | £ 259 |
| 1.2Gb 12mS IDE Drive | £ 279 |
| 1.6Gb 12mS IDE Drive | £ 299 |
| 1.08Gb Drive & RapIDE | £ 339 |

CD-ROM for RISC PC

Connects to IDE port of RISC PC or a port on the RapIDE card. Supplied with dual IDE cable and PlayCD audio CD player software

| Dual Speed | £ 99 |
|-------------------|-------|
| Quad Speed | £ 149 |
| Audio Mixer Board | £ 29 |

In order to allow an IDE CD ROM to be used on A300 / 400 A540 and A5000 machines an interface such as the Watford IDE card must be used - which has an external connector. The software supplied with this card must be upgraded to be fully RISC OS 3.1-compatible. A5000 machines require a chip replacement also.

| RISC OS 3.1 software for Watford Replacement chip for use on A50 External case and power supply for | 00 machines | £15 £8 £79 |

Run by enthusiasts for you All prices INCLUDE VAT and postage **Ouestions** New cases for the A3010, mouse trouble, and games from The Fourth Dimension.

Q I have owned an A3010 since last December, and so far I have been very pleased with it. The only thing which lets it down is its Amiga-style case.

I was wondering if it would be possible to transfer the contents of my computer to a more professional-style case; a minitower case would suit me just fine, but I am not really that fussy about what type of case I have.

Do you know of any Acorn dealers who can supply these cases – any useful information or advice that you could offer to me would be much appreciated.

> David Bloor Newcastle

This is certainly possible; Kimberley Computer Services – tel (01942) 677777 – will do it for around £150, putting the computer in a PC-style case.

However, you should consider carefully if it is worth the money. For such a relatively unexpandable machine as the A3010, the only benefit would he that it looked 'more professional', and even this would be a matter of opinion. For the sort of money that you would spend on putting it in a new case, you could buy some software or hardware that would actually improve the computer's performance rather than just its look.

Q 1 have noticed what seems to be a bug in RISC OS 3.5. If the Menu button on the mouse is used in a Filer window and is operated twice, the computer acts upon the second click as if Select had been pressed, this could be disastrous, as it even works for 'Delete'.

l noticed this because of a fault with my mouse where it was double-clicking for just one press. Is this a bug in RISC OS 3.5 or is something else causing it?

> Mr D L Bergg Southampton

As far as 1 can tell from your letter the RISC OS 3.5 behaviour you are experiencing is actually correct. On any menu, clicking with Menu is equivalent to clicking with Select (the reason probably being that some users like to navigate a menustructure with their fingers resting on the Menu button rather than moving it to Select). This should be true in all windows, not just the Filer one. It was also true in RISC OS 3.1 and RISC OS 2, so it is actually nothing new.

Is your computer still under guarantee? If it is, then you should be able to get Granada Microcare to fix the mouse free of charge. If not, then a replacement mouse should be available from between £20 and £40.

Q G'day! 1 am an Acorn Risc PC user from Tasmania, Australia, 1 accessed the internet at TAFE, where 1 go to school, and found messages about a program called *Game On!*. From what I could figure out, this program allowed the use of the whole

Chocks Away Extra Missions – the Tiger Moth now rules the skies on the Risc PC, thanks to Game On!

screen when playing games on the Rise PC. If this is right, where can 1 get a copy of it from?

I have contacted Fourth Dimension a couple of times, asking about Saloon Cars, Birds of War and Chocks Away Extra Missions. I have heard of an upgrade for Birds of War, but the others won't work either. Is there anything that I can do or get to make them work?

Leigh Rowhottom via the Internet

A 1 think if 1 give Game On! one more plug then The ARM Club will have to give me liree membership. However, it is the only program that does what it does, so I suppose that's my excuse.

Yes, *Game On!* gives you full screen games on the Risc PC. It also enables several games to work that previously had problems with the hardware changes. A new version is due out real soon now, which increases the range of games that will work with it – including *Sensible Soccer* for instance. It is available from The ARM Club on +44 171-624 9918, and *Game On!* release 2 will cost £15.

As to The Fourth Dimension, rumours of its demise have been greatly exaggerated. Under the new management of Rick Sutcliffe, 4D has been concentrating on making many of its most popular games Rise PC-compatible, and is set announce some exciting new releases. Its offices have moved, and its new phone number is +44 114-278 1091.

There is a Rise PC upgrade for Birds of War – costing £5 – and both Chocks Away Extra Missions and Saloon Cars will run on the Rise PC as long as you have Game On! installed.

Programming

HANDS ON

ast month. I finished off by introducing the methods of using pointers to structures. I'll start this month's column by explaining how you can manipulate them, and I'll go on to describe some of the ways in which you can link structures together to create all manner of weird and wonderful data formations.

Manipulating pointers to structures

After you have declared a pointer to a structure and set aside the appropriate amount of memory for it using the malloc() function. it's possible to access the areas of memory to which it points by using the normal pointer notation:

typedef struct {
 int numl;
 int num2;
 } SIMPLE;
 SIMPLE pair[5];
 SIMPLE *pointer;
 pointer = &pair[0];

The fragment above defines a structure named SIMPLE and declares an array called pair which contains five of these structures. A pointer to this structure type is then declared, and it's initialised so that it holds the address of the first structure in the pair[] array. Having done this, it's now possible to access the five array structures through the pointer, as shown below:

```
(*pointer).num1 = 10;
(*pointer).num2 = 15;
```

Remember that at this stage, the pointer contains the address of pair[0], and when prefixed by the asterisk it instructs the computer to access the data stored at that address – in this case, the members of the array held there are being assigned.

Although the compiler is perfectly happy accessing structures in this way, the ampersands and asterisks can become somewhat confusing. To this end, C possesses another operator to make the programmer's life that bit simpler – it's called the *membership operator* and it's written as a minus sign followed by a greater-than symbol. An example is shown below:

```
pointer = &pair[0];
pointer->numl = 5;
```

This method of accessing structures through pointers is equivalent to using all those asterisks, but it looks a little neater.

Linking structures together

In last month's column I referred to an apparent limitation when defining a structure – you're not allowed to include a reference to the structure itself in its own definition, for reasons of recursion. However, I did mention that there was a way round it, and here it is. If, instead of trying to include the structure itself in the definition, you incorporate a pointer to that structure type, the compiler remains happy. This is because the pointer doesn't actually contain the structure; it's more of a signpost capable of sending the computer to an appropriate piece of memory:

struct list {
 int num1;
 int num2;
 struct list *next;
 };
 struct list *root;
 root = malloc(sizeof(struct list));

The code above defines a structure that includes a pointer to a structure of its own type. The last two lines declare a pointer named root and allocate it enough memory to hold the list structure. As things stand, we've only got one structure in memory, and it's not complete – the member called next doesn't actually point to anything yet. However, that will soon change.

struct list *current; root->next = malloc(sizeof(struct list)); current = root->next;

What's happened here? Well, another chunk of memory has been allocated, and its address has been stored in that empty pointer – in effect, we've tacked another structure on to the end of the first. We can keep track of which structure we're looking at with another pointer, named current in the above example. As things stand, there are two structures in memory, one pointed to by root and another whose address is stored in the next pointer inside the root structure itself. A copy of that address has heen stored in current, and this is so that another area of memory can be allocated by the same procedure.

current->next = malloc(sizeof(list)); current = current->next;

We've now got three structures in memory – the first contains the address of the second, and the second holds the address of the third. This is

tor

Programming

what's known as a *linked list*, since each member points to the next one in the sequence. The list can be extended as far as memory allows, and it's possible to step down the chain by making use of the stored pointers. However, we need some way of telling the computer where the end of the list is; if we don't, the program would merrily run down the line of structures and fall off the end – we'd probably witness a spectacular crash.

How do we go about creating a *stop* sign? The simplest method is to store NULL in the pointer at the end of the list. In this way, we can check that the structure pointed to is 'real' and not just a rogue address. The safest way of doing this is to assign the NULL value just after a new structure has been added to the list – this way, you can't forget about it later.

current->next = malloc(sizeof(list)); current = current->next; current->next = NULL;

Some more data constructions

Now that we've designed a linked list, we can move on to create more complex formations. Although linked lists are easy to sort and search,

Steve Mumford

takes a look at

linked lists and

the principles of

their creation

they do have limitations in the fact that you can only step through them in one direction – there's no way of going backwards. If you've just gone past a piece of information, you'd have to start at the beginning of the list and work through it all again. This can be avoided by including another pointer in each structure to refer to the previous item in the list – it requires a little more bookkeeping work, but it can save time in the long run. It's also possible to link the end structure to the first one in the sequence, to form a cyclic list. This can be useful in some circumstances as a buffer.

Linked lists versus arrays of structures

You'll have seen by now that the process of creating a linked list is somewhat complicated, and unless you thoroughly understand where all the pointers are pointing to, it's easy to get hopelessly confused. Because an array of structures is very similar to a linked list in terms of its capabilities, there would be no point in using them unless there were some definite advantages – so, what are they?

Firstly, if you're using an array you must fix the number of elements it contains before you compile it, and once the program is running this value cannot be altered. In order for the capacity of the array to be increased, the code would have to be recompiled. However, with a linked list that problem does not exist, since each element is declared when it is needed and added on to the end of the list using a pointer. Structures can be added at any point during the execution of the program, and the only limit imposed is that of memory.

The other great advantage that linked lists possess is that the way in which they connect to each other can be altered quickly and easily, whereas arrays are fixed. This makes sorting data much easier, as well as the insertion and removal of records. If, for instance, a list contained three structures named A, B and C and the user wanted to swap B and C, all it would involve would be the alteration of the pointers within the structures. C would be changed so that it pointed to B, A changed to point to C, and B's pointer would be assigned a NULL value. If an array of structures were being used, the actual data in those arrays would have to be copied across, involving a good deal more work. Similarly, if a record is to be deleted it can be removed from the list by manipulating the pointers and then the memory that it occupied released by calling free() - something which is impossible using arrays.

Well, that concludes my brief introduction to some of the more complex things you can do with structures – don't worry if it all seems a little confusing at present. The best method of understanding these data formations is to make use of them, so take a look at the disc and create a few data trees for yourself. If there are any topics that you'd like mc to clarify, please drop me a line and I'll do my best to help. See you next month, when I'll introduce the ideas

Getting started

When you first get your computer, it almost seems as though the people who designed it talk a different language, one full of acronyms and mysterious numbers with letters after them. Actually, the common ones are not that hard to understand, hut to do so requires a certain knowledge of how the computer operates.

The ARM processor

HANDS ON

At the heart of the computer sits the processor. Put simply, this gets told what to do and does it, several milfion times a second. The instructions it is given are of the nature of 'add this number to that number' or 'store this value at that position in memory' rather than 'draw a blue square', as they are in machine code. However, by combining several machine code instructions - perhaps in a loop to store a particular value at sequential positions in memory - blue squares may be drawn. The processor knows nothing of this, however. As far as it is concerned, it's just moving numbers around in a series of unconnected instructions.

The processor in the Archimedes is called an ARM (Advanced RISC Machine) processor. Why RISC? That stands for Reduced Instruction Set Chip, and means that the chip is of a new design which knows how to perform a small number of tasks quickly (as opposed to a large number of tasks where the chip has to think longer about each instruction to work out what it is required to do). You can survive without knowing any of this, naturally.

The fundamental speed of the processor is measured by its clock rate, quoted in cycles per second or Hz. Any given

Absolute

Our series for those starting out with their computers continues with some jargon-busting from David Matthewman, aimed at those who don't know their ARM from their RAM.

instruction may take several cycles to execute, hut it will always execute twice as fast on a 2Hz chip as on a 1Hz chip. The original processor sold with the Archimedes A300, A400 series and A3000 was the ARM2, an 8MHz (million cycles per second) chip. The A540, A5000 and A4 had an ARM3, either a 25MHz or a 35MHz chip. The Rise PC has a 33MHz ARM600 and will take faster processors in the luture. (If 33MHz sounds slow, then you should realise that there are other ways of improving speed than increasing the clock rate.)

Closely connected with the processor are three other chips which handle the interfacing of the chip with the outside world: the MEMC to interface with the memory, the VIDC to handle video and sound output and the I/O controller to handle things like the keyhoard. On the A3010, A3020 and A4000 these were all comhined on a single chip – the ARM250.

The operating system on this machine is in the four large rectangular chips on the bottom right of the circuit board.

Memory

The computer needs somewhere to store information to be able to run: programs, text, graphics and so on. This comes in two forms: *volatile memory* which is wiped when the computer is switched off and *static memory* which is not. The most familiar form of static memory is the floppy disc; the most familiar form of volatile memory is the memory on chips inside the computer, which is what is usually meant when someone refers to the 'memory of the computer.'

Memory was originally measured in bytes, later in K (kilohytes, 1024 bytes) and then in Mh (megahytes, 1024Kb). Hard discs can even be measured in Gb (gigabytes, a further 1024 up the scale).

Exactly how big a byte is isn't very important – what matters is relative size. To give you some idea, one byte roughly equates to one character; the text on one page of *Acorn User* is usually between 5K and 10K. Floppy discs hold either 800K or 1.6Mb – hard discs these days are usually over 100Mb. The memory in earlier Archimedes machines ranges from 1Mb to 4Mb or 8Mb, and in the Risc PC it can theoretically be up to 256Mb.

The volatile memory on chips in the machine is called RAM (Random Access Memory). The fact that it is 'random access' is far less important than the fact that you can change its contents. This is really what differentiates it from ROM (Read Only Memory) which can only be read from and not changed. There is ROM in your computer, which is used to store permanent programs like the operating system which will never need to be changed.

The operating system

Speaking of which, the *operating system* is the final part of the jigsaw. This is the program which controls everything else on the machine. I have already said the processor doesn't know or care what the instructions it is processing actually do; the operating system is the part that *does* know and care. As soon as the computer is switched on, the operating system takes

Getting started

beginners

How do you abbreviate 'megabyte?'

There is a certain disagreement over how the units 'byte', 'kilobyte' and 'megabyte' should be abbreviated. You can get by as a beginner without worrying about this, of course, but it can cause some confusion.

In Acorn User, we write b, K and Mb respectively, but this is largely to make the text easily readable. Strictly speaking, the abbreviations should probably be B, KB and MB, with an uppercase 'B' to distinguish them from the unit of information, the *bit* (eight bits to the byte, don't you know?) The 'K' in 'kilobyte' is a/ways upper case, as it means 1024, not 1000 as in the SI kilo- prefix which is a lower-case 'K'. This is because 1024 is two to the power of 10, which is a much more useful number than 1000 when working with binary systems like a computer.

There is, however, no typographical distinction between the M in Mb and the M in (for instance) MPa, despite the fact that the former is 1048,576 bytes and the latter 1000,000 pascals.

control and tells it how to start up. It produces the familiar Desktop display, tells the machine how to read the hard drive, and generates the start-up beep. Any programs which are run rely on the operating system to be there first to do most of the 'hard work.' A program doesn't contain instructions to write data to disc itself – it contains an instruction to tell *the operating system* to write data to disc.

The bulk of the operating system is stored in ROM, although there can be additions loaded in from the hard disc, for instance. That some part of it must be in ROM should be obvious from its nature – if the computer didn't know how to do *anything* when it was switched on it wouldn't know how to read a disc to load in any instructions.

The operating system in the Archimedes is called RISC OS and comes in two hasic

flavours - RISC OS 2 and RISC OS 3. I explained in July how to find out which one is in your machine. The Risc PC has a slightly enhanced version of RISC OS 3 called RISC OS 3.5. All other Archimedes machines can have their operating system chips upgraded to RISC OS 3, and this is recommended. The reason for this is that modern programs increasingly assume that this is the operating system fitted to the machine on which they are running, and won't work as well (or at all) on AU RISC OS 2,

This is what it's all about: the ARM processor (left) and two memory cards containing RAM chips (right).

Jargon box

ARM chip: the processor in the Archimedes.

I/O controller: a chip which allows the processor to control various input and output functions.

Machine code: the language understood by the processor. To you and me it's all just ones and zeros, but the processor knows what it means. MEMC: a chip which sits between the processor and the memory and allows them to talk to each other – this means the processor does not need to know how the memory is actually arranged.

Operating system: the program which controls the computer, including its interface with the user. It could almost be described as the brains of the computer – without an operating system the processor has no instructions to process and the memory has nothing to read from and write to it. Processor: the heart of the computer; this does all the work. However, it only executes instructions – it doesn't know or care where the instructions are coming from or what they will do.

Random Access Memory (RAM): a confusing name for memory whose

contents can be changed. It might more reasonably be called Read/Write Memory, but sadly (because of the way memory developed) it isn't. The main memory of the computer – the memory meant when a '4Mb A440' is mentioned – is RAM,

Read Only Memory (ROM): memory whose contents cannot be changed, only read. This is useful for storing permanent data like the operating system or a table of constants.

RISC OS: The operating system in the Archimedes. It is stored in ROM and kicks in when the computer is switched on. All other programs rely on the operating system to do the 'hard work'.

Static memory: memory which will retain information when the power is switched off: floppy discs, hard discs, CD-ROMs and so on.

VIDC: a chip which allows the processor to control the sound and video output.

Volatile memory: memory which is cleared when the power is switched off.

Why DO people buy from THE DATA STORE?

We're an Acorn specialist - no other brands of computer to distract you.

A large stock of hardware, software and peripherals, all on demonstration if required.

Friendly, knowledgeable and efficient service in person or by mail/telephone order.

Finance terms available (subject to status, written details on request) including six months interest-free on selected items.

Education specialist - for both schools and parents. Assist and Advantage schemes available.

Free parking right outside the shop.

Hardware

Run the

As I have said before, as far as interfacing is concerned, there are two types of Acorn RISC machines; those with bi-directional printer ports and those without. It's not just a matter of the data lines as there are more handshaking lines on the newer machines. The problem is that if I design something that needs the greater capability of the bi-directional port, there are a great number of you who will be left behind. On the other hand, ignoring the capability of the bidirectional port will severely limit the number of projects I can cover. Therefore, for this month only I will address just the owners of older single direction printer ports and we will see how we can hring them up to date.

At first it might seem like *Mission Impossible* to convert the old port to the new, hut with a handful of chips and a small piece of software you can come fairly close to emulating the new hardware. I say 'fairly close' because although you have all the input and output capacity, the price you pay is in speed of access, although for the vast majority of our projects that doesn't matter.

Multiplexing

So how do we pull this trick? Well the secret lies in multiplexing, that is, using one line or channel to carry many different signals. The old printer port does, in fact, have two inputs and we can use those to squeeze all the data and status lines through to the computer. In fact, not content with matching the capacity of the new port, this hardware will actually surpass it, giving you one bi-directional 8-bit port with 8-bits of status input and 7-hits of control outputs.

You can think of a multiplexer as one large

multi-way switch with the choice of what input is connected to the output governed by not the rotation of a switch but the value on a number of binary input select lines. The number of select lines determines how many inputs you can have by the simple formula:

input lines = 2 ^ number of select lines

Or, to put it into words, the number of inputs is equal to two to the power of the number of select lines. Now, as we have 8-bits of the printer output to drive select lines, we could have up to 256 inputs and, given that we have two inputs on the port to squeeze the data through, we can double this up to 512 inputs. I think you will agree that this is going over the top somewhat but you see we have no trouble getting the 16 inputs we need.

Unlike switches, you can't put signals through digital logic in both directions, so to have lots of outputs coming from one input you

need another circuit -ademultiplexer. However, as the signal only appears on the output when it is selected, we need some sort of memory on the other side of the demultiplexer to remember

The multiplexer in all its glory, though quite why it's in front of a Risc PC (which has a bi-directional printer port) is anyone's guess.

Figure 1: Making a tri-state

HANDS ON

the last state of the signals. Fortunately, this sort of circuit is available in a single IC and is called an addressable latch. The 74LS259 is an 8-hit addressable latch and by using two of them we can get the required 16 bits of output.

Inputs and outputs

The only thing we need to do is to make eight of the output bits and eight of the input hits common – that is sit on the same wires. To do this we need a tri-state buffer; the 74LS244 has eight such buffers in one package. Now you might have heard that electronic logic has two states – on or off, one or zero, or true or false, to choose just three sets of names we can give them. However, there is a third

Figure 3: The full circuit for the printer port converter.

state which is a high-impedance (or as I prefer to say a 'don't care') state. The output is not connected to a high voltage nor a low voltage but is just not connected to any voltage. You can see in Figure I that you can think of this system in terms of switches – when the output is disabled it is like the Grand Old Duke of York's men, neither up nor down. This enable state is controlled hy a logic signal and can be used to switch our eight data bits between acting as inputs and acting as outputs.

The hardware is now taking shape and we can draw the block diagram as seen in Figure 2. Here we see that the three least significant bits of the printer port are used to control the data select lines of both the multiplexer and addressable latches. The outputs from the two multiplexers are fed into the busy and acknowledge inputs of the port. Note here that the busy line is an inverting input – that is, the computer reads the inverse of whatever logic level is being fed into it. We can compensate for this in software but there is no need as the 74L151 has a inverting output as well as a true output.

Therefore, all we need to do is use the inverting output of the multiplexer, and the inverting input of the port will turn it the right way up again. The outputs of the addressable latch are fed through the tri-state buffer to join up with the inputs of the multiplexer, so that when the buffer is enabled we have outputs, with the inputs heing ahle to read what we have put out. Conversely, when the buffer is disabled the multiplexer inputs can read whatever logic level we put on them.

So how do we control whether the buffer is enabled or disabled? Well, with the bi-directional printer port it is bit 5 of the control register that determines whether we have an input or output. As we have an addressable latch acting as the control register, we will simply use bit 5 of that. In this way the same piece of software that controls a bi-directional port will work on our emulator.

The full circuit is shown in Figure 3 and is mostly quite straightforward, except that the power supplies and decoupling have been omitted for clarity – these are shown in Figure 4. I constructed the circuit on Veroboard using a wiring pen and had a flying lead with a 25-way plug going to the computer. The new port signals were wired to a 25-way socket mounted on a bracket on the board. The idea is that all the signals are wired into the socket so that any interface simply plugs into the board just the same as it would if it were being plugged into a bi-directional printer port.

There are a few points to note here about the circuit. First of all, look at the three small capacitors and pull-up resistors on the multiplex select lines. These are to prevent oscillations on the lines when they are driven very fast by the software. This happens because the printer data lines are buffered to drive a printer at the end of a long cable and are not designed to be used at the speed we need. Therefore, the resistors and capacitors act as terminators and help prevent signal distortion through reflections at the end of the lines. The second point is that I have put a

link in the tri-state huffer's enable lines. This is so you can remove it if you are using the data port for input: then there is no danger of accidentally connecting two outputs together.

The software

As you know, the hardware is only half the story. To make the bi-directional port emulator truly useful we have to have some software that is capable of driving it. Not only that, but it also has to look exactly like a bi-directional port to any software wanting to use it. Here we can use software written in the form of a module to replace the Parallel Port SWIs just like I did in the May issue of Acorn User. However, this time the module does not just make a stab at producing the same effects as the bi-directional port but actually duplicates them exactly. The beauty of this scheme is that any software that expects to talk to a bi-directional port through the Parallel Port SWIs (and they all should) will work perfectly with the emulator. This means 1 can write one piece of code for all my projects and it will work with any machine.

The module and the source code for this are on the cover disc and you might like to see how it is done. Figure 5 shows the programmer's view of the emulator circuit – what register hits control what pieces of hardware. Basically, what we have to do to perform an input scan is to go through each of the data select line addresses in turn and gather the bits as they appear, in turn, on the busy and acknowledge bits. These bits are then assembled into a separate register.

For the output scan we have to do the same, but this time place the data bit we want to store on bit 7 and then strobe bit 6 or bit 5 depending upon what addressable latch we want to fill. By strobe 1 mean putting the bit down to a logic zero and then up again to a logic one.

The routine that writes to the control register has to be slightly different because of the way Acorn's routines work. Basically, they take two registers and perform an AND and then an exclusive OR operation on the register value before it is output. In order to do this you need to keep a copy of the register value in memory as there is no way of reading it back, either from my emulator or the true bi-directional port. The module therefore needs four bytes of storage space.

Finally, you will remember that some inputs and outputs are inverting, that is, the value the computer sees for some bits is the inverse of the

Figure 5: The programmers view of the interface.

value on the actual hardware. My module simulates this effect in software hy inverting some control hits before writing them and some status bits before passing them hack to the calling pro-

Figure 4: The power supply of the circuit.

gram. The source code for this module is on the cover disc along with the module itself, stored inside the *Port Monitor* application.

When I first wrote the routine I had trouble with the reliability, so I put in a large delay between outputting anything and reading something hack. This was also useful because it made the signals long enough to observe with my oscilloscope. However, by using the capacitors on the select lines and tinkering with the code I was able to eliminate the delays altogether.

Note here that the module copes with all hits of the status and control registers, unlike the hardware it is emulating. This means you have these extra bits to use for anything you want. I will try to avoid using them in my articles, however, because then those projects would not he assessable to those with the newer port.

In order to make use of this new emulating hardware, 1 have had to tinker a little with the *Port Monitor* application 1 gave you in the May issue. Basically, the changes detect the presence of a system variable indicating that this new module has been loaded and thus prevent the loading of the earlier module and produce the right pinout information. It also defaults to inputs on the printer port instead of outputs – this is just a little safer when feeding signals in. As *Port Monitor* appears on the disc it is not suitable for use with the new hardware; to do this you will have to un-comment two lines in the *Boot* file. This is quite straightforward and instructions are given in the file.

There is one slight shortcoming with this emulator hardware and that is the fact that you can't generate any interrupts with the status inputs as you can with the real bardware. This is not too much of a hardship with my projects, hut it might just prevent other applications from working. Also, beware of 'intelligent' applications; these check the system to see what type of port chip is fitted (a bit like my original *Port Monitor*) and could report an incompatibility where none exists.

If you would like to add some relinements to the circuit, how about putting an LED on hit 5 of the control register; in that way the light could indicate whether the port was set to he an output. You could even have two lights – a red and a green – driven from this bit, or the inverse with red indicating output and green input. If you really want to be fancy you could have a two-colour LED and get it to change cofour with changing state. I will leave it to you to work that one out.

So there we have it, we now have a common base with which to develop our interfacing projects, so we can all run the RISC. AU

Questions and answers

Q: How can I get my machine to reboot using nothing more than a software call?

A: My initial reaction to this question is 'Why would you need to reboot from software?', however this is a valid thing to need to do under a very small number of circumstances (such as executing at the end of the exit routine in another operating system).

A 'hard' reset – complete memory wipe and reinitialise from ROM, returning the machine to a state consistent with a machine which has just been powered up – is very difficult to perform in anything earlier than RISC OS 3.5; in this release, we addressed the issue by providing a single SWI (OS_Reset) which effectively calls the reset code for you.

In RISC OS 2, it was possible to get a soft reset (equivalent to a Ctrl-Break) by issuing CALL !-4 from BASIC; in RISC OS 3.1 this facility stopped working.

To get a reset in RISC OS 3.1 requires some low-level programming; essentially, you need to copy the contents of the start of ROM (&3800000) to the ARM reset vector (&0) and branch directly to &0. Before doing this, make sure you are in SVC mode by calling SWI 'OS_EnterOS'.

Adding IDE slave drives

One of the most common queries we receive concerns adding further IDE drives to machines to increase their local storage capacity. In the case of systems with an IDE interface (this includes all our current range, with the exception of the A3010), the system can support a total of

Acorn Customer Services Acorn Computers Ltd Acorn House, Vision Park, Histon, Cambridge CB4 4AE E-mail: customer.services@acorn.co.uk two IDE devices operating in a master/slave configuration. The drives we have tested, and their appropriate link settings, are detailed in the table.

If you are planning to make use of a drive which is not listed in the table, there are a few things to pay particular attention to:

• Drive speed: some drives have slow t/O timings which will work on a machine such as an A3020, which has slower cycle times. A faster Acorn machine such as a Risc PC might have trouble.

• IRQ issues: some drives have a pull-up resistor on the IRQ line. This is not a good idea – the IRQ should be for them. line on IDE drives is a tri-state

output, and is active high, so disabling the IRQ output on the drive can cause an erroneous IRQ.

• Drive selection: some IDE drives support selection of the drive via a signal on the IDE connector – the jumper which enables this is the Cable Select, and is often marked as CS on the drive. The Rise PC does not support Cable Select, therefore connecting a drive with this enabled will not work. Similarly, Spindle Sync must be disabled.

Full IP for all

▼ In response to increasing demand for software to enable connection to the Internet, the Network Group at Acorn has arranged to make available a release of Acorn's implementation of the TCP/IP protocol stack, subject to the licence conditions detailed in the documentation accompanying the software.

The software comprises two archives – produced with David Pilling's *SparkFS* – containing software and related documentation, both software items being compliant with the DCI 4 specification, as used in all new Acorn AUN products:

1) the *InterNet* archive, which contains the TCP/IP protocol stack itself, and which can be found as

| Masler | | | Stave | | | | | | |
|---|-------------|-----------|-------|------|---|-----|--------|----------|-----|
| | Link Settie | (ga | | | Link Settings | | | | |
| DHee | HSP | C/D | DSP | ACT | Drive | HSP | C/D | DSP | ACT |
| CP3044 CP30064E CP30126 CP30174E | | ~ ~ ~ ~ ~ | | 1 | | | No sia | ve drive | |
| CP3044 | | 1111 | >>>> | 1111 | CP3044 CP30084E CP30126 CP30174E | | | | ~ |
| CIP30084E | | 5 | | | CP3044 CP30126 | | | | ~ |
| CP30126 | | 111 | 222 | | CP3044 CP30064E CP30174E | | | | ~ |
| CP30174E | | 5 | | | CP3044 CP30126 | | | | V |
| CFS210A | | 4 | | | CFS210A | | | | |
| CFS420A | | ~ | | | CFS420A | | | | |

A table showing what master/slave combination of IDE hard drives have been tested, and what the link settings should be for them.

ftp.acorn.co.uk:/pub/riscos/releases/DCl4/ internet.arc; the stack has a full BSD sockets interface.

2) the *BootNet* archive, which contains the AUN protocol stack, and which can be found as ftp.acorn.co.uk:/pub/riscos/ releases/DCI4/bootnet.arc

BootNet supplies an AUN programming interface to the TCP/IP protocol stack, using the simplified AUN addressing scheme, rather than full IP addressing.

If used in conjunction with *Internet*, it is important that *Internet* is run before *Bootnet*, and that all appropriate setting up has been done.

This release does not include the client tools which form a part of the 'Acorn TCP/IP Protocol Suite (Release 2)' product, nor does it include some of the more advanced components of the networking software which are present in the above product. You will also need extra software if you intend to access the Internet via a dial-up connection using a modem.

Installing *Internet* is not as simple as installing most other applications, as a fair amount of configuration needs to be done. Detailed documentation on the configuration and installation procedure is supplied as part of the archives.

RiscPC Computer Systems

1

RiscPC offers all the traditional strengths of RISC processing, and a great deal more. It is the world's most cost-effective 32-bit RISC based computer, producing astounding graphics and crystal clear sound. It's innovative design provides virtually unlimited upgrade capability, expanding as your needs increase. Built around the ARM 610 processor, RiscPC pushes computing to the limits, with it's intuitive operating system, support for up to 256Mb RAM, powerful 32-bit graphics and 16-bit sound system. RiscPC allows the use of foreign operating systems via it's unique second processor slot, thus opening up the world of DOS, Windows and Unix to name but a tew. Access to CD-ROM and networking is also provided, making RiscPC an ideal multimedia or network station.

RiscPC 600 Systems include:

- ARM610 processor running at 30MHz
 RISC OS 3 v3.5 operating system
- 3.5" 1.6Mb Floppy Disk Drive
- 2, 4 or 8Mb RAM expandable to 256Mb
 1Mb or 2Mb Video RAM
- 210Mb or 420Mb IDE hard disk drive
- 8 channel stereo sound full 32-bit graphics capabilities
- 2nd processor slot
- 2 or 4 32-bit expansion bus slots
- 5.25" drive bay for CD-ROM drive
 14" EPA 0.28mm SuperVGA Monitor
- 102 key keyboard u 3 button mouse
- optional CD-ROM drive
- 1-year On-Site Warranty (3-year option)

Acorn 32-bit RISC Computer Systems

2

The entry level range of 32-bit RISC based computer systems, ideal for home, education or small business applications The A3010 is aimed at home use, with its built-in TV modulator. it will connect to a stendard colour TV.

The A3020 is the standard education model, ideal es a network workstation or for stand-elone use with built-in hard drive. The A4000 is designed for home and small business use, coming with a 210Mb herd drive end choice of monitor. The A4 Notebook is for those who need a RISC OS machine on

the move. Supplied with 4Mb RAM, hard disk end mouse.

*FREE CD-ROM Drive otter available until end June 1995

Star info

Dave Lawrence and Dave Acton present more programs, tips and techie trivia from beyond the PRM.

'Snowball' and 'hell'...

This wild stab in the dark appears courtesy of Paul Marshall. It is a program to help you choose *the* winning numbers in the National Lottery. Honest, Paul says:

It is an inescapable fact that every draw of random numbers is completely unique; the randomness is unaffected by the draws which have taken place before, and any set of numbers is just as likely to come up as any other combination.

'Yet one can't help feeling that certain number combinations are less likely to win. It *seems* unlikely that for example 1, 2, 3, 4, 5, and 6 could be drawn out by the lottery machine in the same week. And even less likely that they would come out in that order – yet it is possible.

'And supposing the number 27 came out six weeks running. Would 27 be a good bet for the seventh week on the basis that it gets drawn often, or would you avoid it on the basis that it couldn't possibly be drawn again?

'Sadly, it really doesn't make any difference which numbers you choose, so this program will generate for you a set of

six completely random numbers. However, as that's a trifle boring it can also generate a set of numbers from a person's name, or pick at random from the most frequently drawn numbers in past draws, or at random from the least

Author: Paul Marshall

drawn numbers. 'The choice is made by clicking on the caption where the draw method is displayed. A menu will open up. An arrow from "By name" leads to an entry box for the user's name.'

The calculation to compute six numbers from a name needs at least seven characters to work on, Spaces are ignored and case is not important. It may sometimes throw up some identical numbers; there is no way round this unfortunately, but the program does apologise.

Two other windows can be opened from the icon har: 'Statistics' shows how often each number has been chosen. As the weeks go by the distribution should even out – it will be interesting to see if it does. 'Past Winners' shows the results of previous draws and allows each new draw to be entered.

To enter a new result, click on the right-pointing arrows to step through to the next clear position. Enter the date and the numbers, then click on 'Save New.' Once saved, entries cannot be altered. However, the data is stored in a plain text file called 'numbers' within the *Lottery* application, and this can be edited if any mistakes have heen made. Previous winning numbers can be found on BBC2 teletext on page 750.

Star info

One-line corners

Three minute masterpieces now. The first comes from 14-yearold Alister Fields and is one of your colour-cycling numbers. *Columns* builds up a pattern in mode nine using a cunning formula that almost certainly has SINCOSRAD in it, which is then copied across the screen to form strange column-like structures. The palette is then cycled (well, lets face it, what else can you do with a palette?) and the columns pulsate in a moderately disturhing, though mildly entertaining, fashion. The next pair of

Various authors

one-line wonders are truly astounding in their simplicity. Roddy Graham of Motherwell got the idea from *The New Hacker's Dictionary*. In said volume, (which incidentally Roddy highly recommends, so 1 hope they won't mind me quoting their definition) *Muuching Squares* is defined as 'a display hack dating back to the PDP-1 (ca. 1962, reportedly discovered by Jackson

Wright), which employs a trivial computation to produce an impressive display of moving and growing squares that devour the screen."

The 'trivial computation' involves repeatedly plotting the graph Y = X EOR T for successive values of T. A later development from this was the variant *Munching Triangles* and Roddy has supplied versions of hoth. The versions we have included switch to mode 0 at the start so you can hest see what is going on, although you can remove the MODE command so they munch the desktop directly if you like.

Welcome to the machine

If you regularly use more than one computer it is often very handy for software to be able to distinguish between them. For example, one machine might he your main work machine and another only used for printing, modeming and possibly faxing. It is obviously advantageous to keep things such as boot sequences as similar as possible between machines to cut down on maintenance when components are upgraded. However, there will inevitably be differences between them – whether to auto-load the printer driver for example.

One feature of other operating systems which is sadly lacking in RISC OS as it stands is a facility to name machines. When machines are networked they usually acquire a 'host name' so that users can identify the machine on which they wish to log (pardon the split or frankly mangled infinitive) but from day to day your computer remains quietly anonymous.

This is where the utility *MachinelD* comes in, This is an assembly language program that creates two special system variables: Machine\$Name and Machine\$ID to help you sort out your fax server from your printer server.

Having run *MachinelD* you must now think of a name for your machine; you can use any characters you like but are limited to a maximum of 15. To set the name, move to the command line or a task window and type:

*Set Machine\$Name Ermintrude

The name is written to CMOS RAM and will therefore remain even after the machine is switched off. To see the name you can, of course, use *Show Machine\$Name. It can also be used in Obey files to perform tasks:

*If "<Machine\$Name>" = "Dylan" Then Filer_Run ...

All you need to do to use this variable from now on is to include it somewhere in your hoot sequence,

MachineID uses the 15 bytes of CMOS RAM Acom have allocated to the user – hytes 30 to 45. According to the manual, these should not be used in any distributed product – so if anyone from Acorn asks, you wrote this program yourself. In reality, unless you have written anything else that uses these bytes you should not have any clashes with other software [except perhaps *MityMouse* also in this month's *****INFO! – Ed]

The other variable *MachinelD* creates is Machine\$ID. This is a read-only variable and holds the value of the unique machine tD present in machines from the A5000 onwards. As above, it can be displayed or used in *if statements.

If you are interested in these things, the source code for MachineID is also provided for you to peruse. Both of these variables are code variables, which means that rather than heing a fixed number or string like the numerous other system variables, their value is set to he a piece of code which is called whenever the value of the variable is needed. The system variable Sys\$Time is an example of another code variable -- its value is always the current time read from the system clock. Machine\$Name can also be written to - when a *Set is performed on a code variable another piece of (user supplied) code is called to set the value, in this case the bytes of the string provided are written to CMOS RAM.

Author: Dave Lawrence

One rather strange concept of code variahles is that their values don't exist anywhere until you ask for them. Unlike in BASIC where you might have:

name\$ = "Fred"

resulting in name\$ thereafter containing 'Fred' in a little cubby hole somewhere in memory – you could see it if you had a fiddle with a memory editor for a while. Unless something has taken a copy of Machine\$Name you won't find the string 'Ermintrude' anywhere in memory (except of course in CMOS, but you can't see that anyway).

ANDS ON

Author: Darren Salt

HANDS ON

Stretching the point

Darren Salt's application takes path objects from *Draw* and moulds them to fit between two other paths. You know – the kind of thing you keep seeing *ArtWorks* doing.

When *DrawShape* is loaded it puts two icons on the icon bar, and both of these appear as raised slahs. The left-hand slab has two cyan lines on it, one above the other – this is the mould icon. The righthand slab has a pair of compasses on it – this is the image icon. It initially appears greyed out hecause *DrawShape* has no mould to use. You should proceed as follows:

1. Select the two paths you wish to use as the template.

Export them to *DrawShape* (use 'Save selected'), dropping them on the mould icon.

3. Select the paths (or path groups) you wish to mould.

4. Export them to *DrawShape* (save selected), dropping them on the image icon. Export the whole file if you want to process the whole file.

5. DrawShape will process the file, and

puts the resulting file back to *Draw*. This can now be comhined with the original drawing.

The two paths describe the upper and lower bounds of the moulded image. Whichever is used as the lower bound must be 'in front of' the other path. It is important that the paths used in the mould: • are individual path objects

do not contain moves

are not grouped together,

If the paths are rejected by *DrawShape*, you will be told why, and the previous mould (if there was one) will be retained,

There are a number of options which may he chosen using the icon bar menu. Fast: this controls whether the screen is blanked while moulding. When on, this option reduces the time taken by around 12 per cent.

Shortcut: this controls which of two line length calculation methods is used – the slower one is much more accurate, but the faster method appears to have little effect on the output quality. Using the laster method reduces the time taken by around 45 per cent. With hoth options on, the time taken is around 49 per cent of the time that would otherwise be taken.

Clear: this causes *DrawShape* to forget about the current mould definition.

For details of the moulding process used, see Michael Attenhorough's article 'Round the Bend' (*Acorn User* December 1992).

Red Square-d

There is a medieval method of multiplication, known as Russian multiplication, which needs only the ability to multiply and divide by two and to add.

The numbers to be multiplied are placed at the heads of two columns. One number is then multiplied by two, while the other is divided by two, remainders are ignored, until the number one is reached. If any number in the division column is even, the corresponding number in the multiplication column is deleted. The remaining numbers in this latter column are then added together. The result of this addition is the product of the two original numbers.

Mr L T Thurlby has sent in a simple basic program to illustrate this cunning mathematical short cut. Don't you think that if you didn't have the incredibly useful MUL instruction in ARM code that this would be a speedy way of multiplying in code?

Especially as computers do like dealing with multiplying by two (ASL) and dividing by two (ASR)...

Author: Darren Green

Poetrio in motion

Don't be fooled for a second here. We make no bones about the fact that this is another variation from the *Tetris* school. However, this particular example of block-dropping fun from Darren Green is one of the best varieties of the genre, so worthy of inclusion, we thought.

Once installed, cfick on the *Trio* icon to open the main 'Bucket.' Surprisingly enough, a variety of multicoloured thingies are dropped one by one into the bucket. Each one consists of three coloured blocks. You can move them left or right (with Z or X by default), cycle the order of the blocks (with '- that is, the key next to Return. No hang on, if you've got a Rise PC it's next to #. Oh well, never mind -- just try a few keys around that general area) and drop the current block (with /).

When three or more blocks are positioned in a line, you score points (your score is shown in a little

window of its own). In fact, you score the square of the number of blocks in a line, so try and get long lines if you can.

A special block (marked with a sunken red horizontal bar) will appear in pieces from time to time. When this reaches the bottom, the whole line is obliterated, although you will score no points in the process. Such blocks are ideal for removing awkward rows of mismatched squares.

As you might expect, the game ends when your bucket is full and the next block has no room to descend. There is a high score table, for those adept enough to achieve a place on it, and a key defining window if you've worn out Z and X playing all the other *Tetris*-like games.

A simple menu is provided and this includes a Pause option. The game can also be paused and restarted by clicking on the Bucket window.

Star info

Mighty Mouse

We must apologise to Michael Stirling, whose little application was due to feature in July's *****INFO, but the gremlins cut this text while leaving the program on the cover disc. In case any of you found the application, and wondered why we didn't mention it, here are some belated details.

We presume Michael may be lefthanded, or have ambidextrous tendencies, since his module is designed to help such folk. The author explains:

'If the mouse is placed on the left, then the Select & Adjust huttons are in the wrong place, making it awkward to use. I came across this problem when I wanted to place the mouse on the left, to fit in with the arrangement of my table.

There appears to be no way of reconfiguring RISC OS to swap the effect of the

Anamorph Art

mouse buttons, so I have written a module that intercepts OS_Mouse and post-processes it to swap the positions of Select and Adjust. The software consists of the application *MityMouse*, and double-clicking on it loads the module *MityMouse* which performs the button swapping.'

Michael has included the source for those interested and it serves as a useful example of a module which provides SWIs and configures CMOS RAM.

The module has a single * command. *Buttons which takes as a parameter 0 to 3. 0 means 'normal', 1 means 'swapped'. 2 and 3 mean the same, only the status is also written to CMOS RAM (user location 30). You will need to add a

*Buttons 1

Authon: Michael Stirling

line to the *!Run* file of *MityMouse* for the program to automatically swap the buttons when run. The call:

SWI "MightyMouse_Buttons"

performs a similar action. R0 contains the new status required and R1 a mask. That is, the button state is set to:

(old AND NOT R1) OR (R0 AND R1)

On exit, R0 contains the old state, so call with zeros to read the current state.

Another SWI, MightyMouse_CmosAccess is included to allow the reading and writing of specific bits of CMOS RAM. On entry, Rt=CMOS location, R3=value to read/write and R4 is a mask. On exit, R0=old contents, R2=modified contents and the other registers are preserved.

Author: Jan Vibe

Anamorph art is the strange subject of this pair of demos from regular Jan Vibe. They were inspired, apparently, by an article on the subject in *Scientific American*. The idea is to take an ordinary picture and squish it in a peculiar way so that it can only be viewed using a special mirror, in this case, a roll of tin foil. Simply hold said roll of foil against the screen at the appropriate place and all will be revealed.

Anamorph1 is just a little demo to show the morphing process and simply converts a pattern into an anamorphic image. Anamorph2 does the real business, taking as input a sprite file and then converting into something unrecognisable. The size of the sprite is irrelevant since it is automatically scaled. (No doubt some bright spark of a reader will now send in a program to convert the desktop into an anamorphic image – we've already had a 3D desktop if you remember.)

As Jan Vibe programs generally appear in threes in these pages, here is a golden oldie from our Danish friend which we don't think ever actually made it into the mag. Apologies to Jan for not using his fine demo, *Waves*, sooner. We've actually carried quite a lot of programs called *Waves* in the past, hut the waves in this case are not ripples across some 3D pond or in some plasmic pool. In fact, they are waves of colour moving around the surface of a tube which winds its way around the screen.

This is a classic example of Jan using sprite masks and some clever BASIC to achieve effects you would normally only expect from machine-code demos. A sprite (called 'box' for some reason – perhaps box is Danish for tube,..) is created with a pattern of rays of different colours emanating from the centre.

| Compatibili | ty table | | |
|-----------------|-----------|-------------|-----------------|
| Program | RISC OS 2 | RISC OS 3.1 | RISC OS 3.5/3.6 |
| Trio | × | V | ~ |
| MachineID | V | V | V |
| Lottery | V | V | V |
| Columns | V | V | V |
| Square/Triangle | V | V | V |
| DrawShape | × | V | V |
| MityMouse | V | V | V |
| Russian | V | V | V |
| Anamorph | × | V | V |
| Waves0 | V | V | V |

Then, by redirecting output to the sprite's mask, a hula-hoop shaped piece of the sprite is cut out and plotted on the screen. This process is repeated to build up the 'snake' but each time the ring is cut out, this is done from a slightly different place in the sprite. In this way, the pattern around the edge of the tube alters along the way. All the time this is going on, the palette is gently cycled in time-honoured fashion, with splendid results.

All submissions most welcome. They needn't be huge applications – in fact the supply of 'Hints & Tips' seems to have dried up a bit, so more of those little gems please. Send all your bits and bobs to: ***INFO**, Acorn User, IDG Media, Media House, Adlington Park, Macclesfield SK10 4NP.

C

You needn't include a letter (if like many contributors you have an allergy to the printed word) but do please put your name, address and program title on every disc and include a text file containing at least your name, address and disc contents. An SAE will ensure your discs are returned and any other instructions, diagrams, saved screens and so on are most welcome.

Choose a FREE GIFT or exclusive special offer when you subscribe to ACORNISER

Choose any one of these excellent free gifts or special offers when you subscribe to the most established, informative Acorn magazine in the world, each and every month.

Subscribing takes out the hassle of trekking down to the newsagents each month as every issue is delivered to your door, postage free. You're also protected against any cover price rises that may take place over the duration of your subscription.

The best way to subscribe is by continuous quarterly direct debit, where you can spread the cost with a small payment each quarter, rather than paying one lump sum in advance. Plus – you can forget about the worry of your subscription ever lapsing, as it runs until you are ready to cancel. PIPEDREAM 4

The Moxon Interview

Pat Cleaver

We went on to give out awards to the Acorn staff, and I think people realised then that we were not standing with knives in each other's backs. f things had turned out differently, Pat could have taken this interview photograph. We're sitting in one of the many excellent pubs on Exeter quay, where she once spent a week working on a project for a photography course.

'My tutor came down to the quay and caught me sitting outside one of the pubs,' Pat recalls. 'He said: "You don't look like you're working hard," but I assured him I was. Pub gardens are a perfect place to sit and observe people, full of photo opportunities.'

Is she serious? There's a mischievous twinkle in Pat's eye as she says this. On the other hand, the photographs were good enough for her tutor to suggest that she could take up photography professionally. She nearly went to do a degree in it at Nottingham, but for various reasons decided she needed the stability of a job in Exeter. Photography's loss was Minerva Software's gain.

Minerva Software is one of the few Acorn companies who are long-lived enough to predate the Archimedes. Pat joined just before the Arc's release; upon arriving she was presented with the Acorn equivalent of the Official Secrets Act to sign before they'd let her near the A500 prototype Arc hidden away in the attic.

Joining Minerva eight years ago on the accounts and secretarial side, Pat was taken to a show at Alexandra Palace where she found she had a talent for talking to people in the market. She quickly moved more into the sales side, and is now Sales and Marketing Manager.

'I enjoy being in this market; it's very friendly. No one gives a damn what anybody

else is or does, as long as you all get on and do your job and work together – there's no backbiting, not that I've come across.

'A few years ago, we were a bit head to head with Clares because we both had an art package out at the same time, but that was built up more outside the company than it was inside. It was quite strange, because Dave Clare and I have always got on well, and we were both discussing how surprised people were - "You're talking to each other?" At the end of one Acorn roadshow, where there was always a bit of fun and games with Acorn giving out awards - funniest joke, heaviest bar bill - after Acorn had done their awards, Dave and I stood up and said: "Right; we're going to do the Pro Atelier awards." We went on to give out awards to the Acorn staff. and I think people realised then that we were not standing with knives in each other's backs."

Pat is a true Acorn fan, though this is perhaps unsurprising given her first introduction to computers.

'Where I worked before I joined Minerva they had a little Amstrad word-processor; one of those with the 3in disc drive that wasn't ahle to read discs from anything else. I was told that this was "the computer" and I had to use it to write letters, do the accounts, everything. It was a nightmare. The relief when I got to Minerva and found these easy-to-use BBC micros was indescribable.'

People who've been in the Acorn market for a while may recall that when she started at Minerva, Pat – who incidentally attended the first ever Glastonbury Festival – had what she describes as 'slight Gothic tendencies.'

'I was labelled in the early years as "Punk Pat", because I was ... well ... going through different coloured hair. It was never outrageous; I suppose there was the *odd* occasion when I might have had a *little* bit of pink in there, and I also wore quite a lot of black. Obviously "Punk Pat" was more alliterative than "Gothic Pat".'

Pat's creative tendencies have been put to good use by Minerva. She designs most of the artwork for the company – software packs, literature and advertising – using *Draw* on the Archimedes which she finds much quicker than *Impression* for the sort of work she does. And best of all, it comes free with the machine, a fact that Pat feels that Acorn should make more of.

The very recent changes in the way Acorn sells to education came as an unwelcome surprise to Pat, who was all geared up to sell Acorn to the schools in her area and now finds that Acorn have 'kicked her in the teeth'. She'll bounce back though – she regularly goes mountain biking over Dartmoor, and admits:

'Sometimes I wonder why on Earth I'm doing it when I'm pushing uphill, or tumbling over the handlebars into the mud and thinking "Why am I here?" Then I go across a bit of moorland and there's nobody in sight, you've just got this spectacular view of heather and woodland, and then...'

'Then I wish I'd still got the camera.' AU David Matthewman

The Formula 1 package for original painting and photo-retouching Studio24 leaves the competition at the starting grid with its power and performance. The FREE updating service ensures that once you join the Pineapple team you will never have to my for the latest model!

Why are you waiting

when you could be using an Aleph One Risc PC card?

Y ou won't wait around for an Aleph One Risc PC card. Its powerful 486DX processor will complete tasks much more quickly than the alternatives. The card fits easily into your Risc PC's second processor slot in a few seconds.

able VRAM being fitted to the Risc PC, you can enjoy up to 24-bit colour and a 256 colour palette in 8-bit per pixel modes.

Share Acorn peripherals

Fast processors

Software executes at real PC speeds with a choice of pow-' erful 486DX-40 or 486DX2/80 processors blazing through all your tasks.

Windows support

You can use most standard Windows or DOS software on the Risc PC card – at the same time as your existing RISC OS software. You may also wish to connect to existing PC networks.

Save money compared with the cost of buying separate systems: the PC card can use all your Acorn peripherals including hard discs, re-

cards and printers.

Connect to PC networks

movable discs and CD-

ROMs, Ethernet network

Use the Risc PC card with optional networking software to bridge between your computer and local area networks. Any PC network server can be used – Novell Netware or Windows.

ARM graphics support

While you're working in Windows, the RiscPC's ARM processor is still busy acting as a graphics accelerator to further boost performance. High-resolution Risc PC video modes are supported, up to 1280x1024 resolution. Subject to suit-

Recommended retail prices

Choose from the 486DX-40, running at 40MHz, for £349, and the 486DX2/80, running at 80MHz, for £399. Cards are available direct from Aleph One.

Also still available at new reduced prices – Aleph One podule 486 cards for the A5000, A540, A4x0. 486SLC-25 is £299 and 486SLC2/50 is £349 (prices exclude VAT and RAM). RAM for Risc PCs and podule cards £99 for 4MB, £199 for 8MB and £379 for 16MB. All prices exclude VAT.
