

# INTER-SHEET

## The electronic spreadsheet program

Spreadsheet programs have become one of the most popular micro-computer applications in recent years. They can be thought of as a totally general purpose numeric tool, of use to anyone who has to handle figures, calculate costings, keep control of running costs, or just simple budgeting.

This package contains the ROM software, a quick reference card, an introductory manual to spreadsheets and a comprehensive reference manual. Chip fitting instructions and a function key strip are also included.

The program has many quite unique features.

- 40, 80 or 105 column screen display. The special 105 character screen mode displays more than any other spreadsheet.
- Up to 16 spreadsheets may be stored in memory at once.
- Data can be transferred from one spreadsheet to another.
- Spreadsheet data can be transferred to and from popular wordprocessors such as WORDWISE and VIEW.
- This package will integrate directly with other ROM-LINK compatible products, such as INTER-CHART, which can produce charts and graphs of data from the sheet.
- Formulae in boxes are tokenised to save space. This means larger than normal spreadsheets can be accommodated.
- Main menu enables even the inexperienced user to operate the more complex functions. There is no need to remember long command names.

There are, in addition, many other powerful features such as:

Variable column widths. Flexible replication facilities. Insert and delete rows and columns. Numbers may be printed in three formats. The number of decimal places is variable from 0 (integer) to 9. Locking/unlocking of boxes. Boxes may be justified left or right for numbers and left, centre or right for labels.

Most of the above features can affect individual boxes, rows, columns or the entire sheet.

INTER-SHEET supports a large range of high precision mathematical functions. These include all the more common functions such as SIN, SQR, TAN etc. , but also include special sheet functions like SUM, MAX, MIN, LOOKUP, AVERAGE.

A special form of windowing has been included allowing any row or column to be held on screen as the sheet scrolls underneath.

This product does not require an add-on 2nd processor.

All in all these features go to make INTER-SHEET the most powerful and flexible ROM based spreadsheet available for the BBC Micro-computer.
